13 November 2026

Vattenfall · Business Area Wind · OT Infrastructure · Kolding · REF13257I

Application: OT O&M Manager, Infrastructure

A wind farm you cannot see is a wind farm you cannot run. When a data concentrator stops forwarding at three in the morning, nobody in the control room asks which server it was; they ask why forty turbines went quiet on the screen — and how long it will take before someone can act on them again. That is the product this role owns: not servers, but the operator's ability to see, decide and act — what you call **"secure connectivity, monitoring, control and operational data exchange"**. It is also why the service is invisible on the days it works, and unforgiving on the day it does not.

"You do not need to be the technical expert in every infrastructure domain", you write. I would go one step further: the owner of this service should be able to read the architecture, challenge a recommendation and still let the specialist make the call. I have run operations that could not stop — a wastewater plant in 24/7 duty for five years, with SCADA, PLCs, HV switchgear and on-call rota — and I have been the one called at 03:00. What I have not done is own an OT estate for a wind fleet. That is the gap, and it is a gap of scale and domain, not of method.

Two documents, five themes. A service owner is judged on two documents: the runbook — what happens tonight — and the roadmap — what stops us having the same night in two years. I would hold both for each of the five themes below.

Availability and recovery. *Runbook:* a written escalation path, a named second line and a tested restore, not a backup that exists. *Roadmap:* redundancy designed into the **"Edge-to-Wide-Area connectivity solutions"** so a single link is not a single point of failure. I have run a plant where an unplanned stop cost production by the hour; the restore procedure was rehearsed, not hoped for.

Incidents and recurring problems. *Runbook:* one incident owner, one timeline, one customer message per hour while it burns. *Roadmap:* **"incidents, recurring problems and improvement needs"** closed as a class, not one by one — the third identical alarm in a month is a design conversation with Engineering, not a fourth ticket — **"driven through to sustainable resolution"**. That discipline is what took 37 capital projects to handover with zero critical deviations.

Lifecycle and the estate. *Runbook:* patching windows agreed with Operations, and an inventory that is true — every concentrator, every gateway, every version. *Roadmap:* a replacement plan with years and money attached, so the end of support is a decision taken in advance rather than an incident taken on the night.

Cost and governance. *Runbook:* a monthly page — availability, incidents by cause, backlog, run cost. *Roadmap:* the budget conversation held with numbers that Operations recognises, so growth in the fleet is matched by growth in the service. Governance is not a meeting; it is the decision log that shows who decided what, and when.

People and interfaces. *Runbook:* a rota people can live with, and specialists who are allowed to be the expert. *Roadmap:* a competence plan across OT, IT, Cybersecurity, Procurement, projects and suppliers, so the service does not depend on one person's memory. I have led 25 specialists, 14 fitters, 12 technicians and eight employees — and learned that **"empowering technical specialists"** is a discipline, not a phrase in a values deck.

What I would need to learn, and how fast. The wind domain: how a wind farm's OT estate is segmented, what the cyber baseline requires, and which dependencies sit between site, control centre and enterprise. My starting point is real — SCADA and PLC operations, HV and LV systems, networked control in a plant that could not stop, and a maskinmester degree behind it — but I would spend the first months on site and in the architecture reviews rather than in the slideware.

Why Vattenfall, in your own words. Yours is **"a leading European utility"** that has been **"electrifying industries, powering homes and transforming life through innovation"** for **"more than 100 years"**, with **"fossil freedom"** as the strategy rather than a slogan. BA Wind carries **"24GW of capacity"** and calls itself **"one of the most exciting pipelines in the industry"**; the OT team is **"the operational backbone of Business Area Wind"**, and you are explicit that **"leadership, Accountability and Proactivity"** weigh as much as technical depth. That is the job description I recognise: **"the structure and momentum needed"** to **"keep the service fit for future business requirements"** — in a team of **"1,700+ colleagues from 50+ nationalities"** with **"an open, supportive culture"** and **"a healthy work-life balance"**.

Practical. I live in Måløv today and I am ready to relocate, so my working week is in Kolding. English is my working language with suppliers and international colleagues, Danish is my first language, and Persian is my mother tongue. Available after agreement and happy to go through the screening your critical-infrastructure role requires; references on request.

Kind regards

Shahram Ajloo

SHAHRAM AJLOO

OT O&M Manager, Infrastructure · service ownership across sites

+45 93 99 95 14 · ajlooshahram@gmail.com · linkedin.com/in/shahramajloo · Måløv, Denmark

PROFILE

Operations and service leader with control systems, 24/7 duty and full P&L behind him — authorised maskinmester (LV/MV/HV), B.Tech in technology management and mechanical engineering. Five years as operations and maintenance manager of a plant in 24/7 duty with SCADA, PLCs and HV switchgear; **37 capital projects** commissioned and handed over with FAT/SAT and IQ/OQ/PQ; 25 specialists, 14 fitters and eight employees led. Works in service performance, incident and problem follow-up, lifecycle and cost — with the numbers on one page.

THE DATA PATH — HOW I READ AN OT SERVICE

- **The concentrator:** Where the site becomes data: if it stops, the operator is blind while every turbine turns. That hop is what the service is really measured on.
- **The telemetry:** Which signals matter, how often they arrive, and what happens when they arrive late — monitoring that nobody reads is a licence, not a control.
- **The edge link:** Site to wide area, and the failover behind it: one link with no alternative is a single point of failure with a business case attached.
- **The historian:** Where the evidence lives after an incident; without a reliable backup and a tested restore, every post-incident review becomes a discussion about memory.
- **The patch window:** Lifecycle managed with Operations, not against them: a maintenance window agreed in advance is a change; the same patch without a window is an outage.
- **The service page:** Availability, incidents by cause, backlog and cost — one page that lets a decision be taken in a meeting.

EXPERIENCE

Owner / Technical Director — ELOHVAC ApS · Copenhagen · May 2023–present

Scope: 5 electricians and 3 apprentices · full P&L · contracting and service

- **Service, cost and accountability:** Service management with agreements, response times and cost per case; full P&L and budget responsibility; recruiting, onboarding and coaching of eight employees; APV, LOTO and safety.

Co-owner and CTO / Technical Lead, AI department — Data Power Consultant ApS · Copenhagen · 2024–Nov 2026 (alongside ELOHVAC)

Scope: 4–10 people · technical and industrial applications

- **Data, monitoring and reporting:** Monitoring and KPI models for technical services; company has ceased trading.

Senior Commissioning Engineer / Project Manager, electrical systems — Novo Nordisk A/S · Kalundborg/Bagsværd · Nov 2022–Jul 2024

Scope: 37 parallel capital projects · 25 specialists · GMP/FDA/EMA

- **Commissioning, interfaces and handover:** FAT/SAT, IQ/OQ/PQ and handover across 37 projects; zero critical deviations, and documentation built while the work was done rather than after it.

Project and Workshop Manager — Ventek-Air · Copenhagen · Jan 2022–Nov 2022

Scope: 14 employees · 11 simultaneous site projects

- **Capacity and supplier interfaces:** Daily capacity plan for 11 sites and 14 fitters; subcontractors and suppliers coordinated so interfaces did not become delays.

Operations and Maintenance Manager — Biofos (Lynetten) · Copenhagen · Aug 2017–Jan 2022

Scope: Wastewater plant in 24/7 operation · SCADA, PLCs, HV switchgear

- **24/7 operation, incidents and energy:** On-call duty and incident management around the clock; root-cause follow-up and planned maintenance; over 40 % lower energy consumption through measurement and re-commissioning.

Electromechanical Technician / Production Team Lead — ARJ Engineering · Tehran · Dec 2003–Mar 2010

Scope: 12 technicians · machine shop · machinery and equipment

- **Assets, maintenance and training:** Fault finding, calibration and repair of machines; purchasing and maintenance of equipment; training and follow-up for 12 technicians.

EDUCATION AND AUTHORISATION

B.Tech, Technology Management and Mechanical Engineering · Copenhagen School of Marine and Technical Engineering · 2017–2022 · GPA 7.6/12

Authorised maskinmester (LV/MV/HV) · Danish Safety Technology Authority · May 2023

Refrigeration and ventilation technology · AMU · Mercantec 2021 · STCW, Danish Maritime Authority 2021

Electrical and mechanical engineering design, electrical engineering · Tehran Technical University · 2000–2003 · EQF 6

LANGUAGES, IT AND PRACTICAL

English (working language) · Danish (first language) · Persian (mother tongue) · **IT**: **SCADA** and **PLC** operations and log analysis, industrial networks and **monitoring**, **MS Office** with **Excel** models for availability and cost, **ERP** and ticketing systems, own **Python** tools for data · **Driving licence B and own car** · Ready to relocate for Kolding · Available after agreement · References on request.

THE ROLE AS ADVERTISED — WHAT I BRING

Requirement	Evidence
End-to-end accountability for the OT Infrastructure service area	Owned a 24/7 operation and a company with full P&L: availability, incidents, cost and improvement on one page, signed by me.
Lead and develop the service area teams and set clear priorities	25 specialists, 14 fitters, 12 technicians and eight employees led; priorities set weekly and specialists left in charge of their own expertise.
Empower technical specialists to deliver	The technical call stayed with the specialist; priorities, risk and money stayed with me — and both were written down so nobody had to guess.
Risks, incidents and recurring problems driven to resolution	Incident management in 24/7 duty with root-cause follow-up: the same failure twice became a change in design, not a third repair.
Own the service strategy and roadmap, including budget and lifecycle	Roadmap and budget written from an asset inventory: what is end-of-life, what it costs and which year it must happen — the discipline of 37 CAPEX projects.
Operational governance using performance, risks, KPIs and technical input	Monthly KPI page with availability, incidents by cause and backlog; decisions logged with owner and date, reviewed before the next period.
Manage stakeholders across OT, Operations, IT, Cybersecurity, Procurement and suppliers	Twenty years across disciplines: electrical, mechanical, control and suppliers at Lynetten; consultants, contractors and quality at Novo; customers and vendors in my own company.
Manage critical incidents and operational risks with leadership and escalation	On-call leadership for five years: escalation path named before the shift, one incident owner, and the plant informed before it asked.
Make lessons learned result in sustainable improvements	Every significant incident ended in a written change — procedure, spare part, training or design — tracked to closure; that is how 37 projects reached handover clean.
Drive continuous improvement and challenge existing ways of working	Continuous improvement measured, not claimed: over 40 % lower energy consumption at Lynetten came from challenging the existing setpoints with data.
Keep the service reliable, resilient and fit for the future	Resilience built before it is needed: redundancy, tested restore, a rota that survives holidays — learned where the alarm did not care what day it was.
5+ years in operational management, O&M, IT/OT service management or asset management	Operations and maintenance manager for five years, project and workshop management, service ownership and full P&L since 2023 — asset-intensive throughout.
Leading technical teams or services with a track record of improving performance	Teams of specialists and fitters led through measured improvements: energy, capacity, handover quality and delivery on the agreed date.

Good understanding of OT infrastructure, sufficient to lead specialists	Operational technology in daily use for five years — SCADA, PLC, industrial networks and monitoring — on the operator side, where a wrong decision stopped production; enough to challenge a recommendation and know when to defer.
Service management: performance, incident and problem management, lifecycle, risk	Service agreements with response times and SLA, incident and problem follow-up, lifecycle planning and risk management with a named owner — not a spreadsheet.
Strong stakeholder management and communication across functions and suppliers	English and Danish in writing and in the room: technical teams, suppliers, authorities and management — including the conversations where the message was not welcome.
Relevant degree in engineering, technology, business or equivalent experience	Authorised maskinmester (LV/MV/HV) and B.Tech in technology management and mechanical engineering, GPA 7.6/12 — plus twenty years of practice.
Fluency in English, written and spoken	English is my working language with suppliers and colleagues abroad; documentation, procedures and reporting written in English for years.
Central server infrastructure, asset data concentrators, backup and restore	Not my domain yet. I have run the operational side of SCADA and PLC estates, including backup and restore tests, on onshore assets and in 24/7 plant; the difference now is the architecture, not the discipline.
Communication backbone and Edge-to-Wide-Area connectivity	Networks and remote sites at Ventek-Air (11 sites) and Lynetten (24/7): connectivity and failover in onshore plant as operational risk, and the WAN hop as the dependency it is — the same logic an offshore fleet depends on.
Challenge recommendations and make informed decisions	Recommendations tested with three questions: what does it protect, what does it cost, and what happens if we wait — then decided, and written down with the reasoning.
Create clarity and set priorities for specialists	One board, one list, one status: what is being worked on, what is waiting and what has been dropped — visible to the team and to Operations.
Provide direction during incidents and operational pressure	Calm is a procedure: contain, communicate, restore, review. Practised through five years of nights when the plant was down and the phone did not stop.
Collaborate across functions and be solution-oriented	Solutions arrived at with the people who have to live with them — Operations, IT, suppliers — rather than announced to them afterwards.
Motivated by improving reliability, resilience and ways of working over time	The part of the job I keep coming back to: the second year is better than the first, because the failures of the first were written down and designed out.

FIRST 90 DAYS

- Weeks 1–2: read the architecture, the incident history and the risk register; a shift in the control room and a site visit — without changing anything.
- Weeks 3–6: one page per theme with availability, incidents by cause, backlog and run cost, so the service area has a baseline everybody recognises.
- Months 2–3: escalation and incident ownership written down and tested; the three recurring problems with the highest cost taken to Engineering with a proposal each.
- Month 3: roadmap draft with lifecycle years and budget, reviewed with Operations, IT, Cybersecurity and Procurement.

WHAT I WOULD ASK

- Which dependency hurts most today — the site link, the concentrator estate, or the OT/IT interface?
- What does the lifecycle look like in three years, and is the money set aside for it?

I would welcome the chance to visit Kolding and the OT team. Contact: +45 93 99 95 14 · ajlooshahram@gmail.com.
