Eaton · Data Center Project Manager, EMEA Projects · Copenhagen, Denmark

Application: Data Center Project Manager

To Eaton EMEA Projects

Dear EMEA Projects team,

A data centre project is decided long before the first UPS is energised — in the documents that state what was sold, what will be built, and who signs when it is done. Your project managers own that chain from purchase order to handover, across **medium voltage** and **low voltage** distribution, **UPS** and **batteries**, and the **DCIM/EPMS** layer that has to talk to all of it. I have run that chain for twenty years: electrical scope, **commissioning**, and the discipline of never taking a system offline that someone depends on.

Below are the six documents I would own on a **data center** project, and what I bring to each.

1 · The scope baseline. What the purchase order covers and what the customer heard are rarely the same sentence. On a **data center** the gap sits in the interfaces — between **switchgear** and **UPS**, between batteries and controls, between the plant and the **DCIM** that is meant to see it — in drawings and **schematics** that have to agree with the panels as built. My first document names those interfaces and the boundary, so the kick-off is about method, not about what was sold. I closed that gap on 37 concurrent CAPEX projects across engineering, **procurement** and site.

2 · The schedule. A schedule that lives only in the planning tool is a wish. I keep an eight-to-twelve week look-ahead with dependencies, deliveries and hold points, review it weekly, and report daily from site once the work is live. **MS Project** and **Monday** are the tools; the rule is one task, one owner, one date — and the **customer** hears about a slip from us, before they see it.

3 · The risk register. A risk is not a worry; it is an entry with an owner, a trigger and a date. Four years of 24/7 operation on a treatment plant taught me what an unplanned outage actually costs, so outages were planned into narrow windows with the temporary solution designed before it was needed. That is the same habit a live data hall demands: you do not discover your fallback during the switchover.

4 · The cost forecast and the variation log. Margin on an **engineered-to-order** project is lost in the small changes nobody priced. Every variation is priced, owned and approved in the week it appears, the monthly **forecast** reflects it, and the customer sees the number before it becomes an invoice. I ran that on 37 projects in SAP ERP, and I run it now with my own P&L.

5 · The SAT script. Commissioning is where a project proves itself or finds its excuses. I write the test before the test: FAT/SAT protocols, IQ/OQ/PQ documentation and acceptance criteria agreed with the **customer** and **quality** records that stand up in an audit, with findings closed by root cause. Zero critical findings at **handover** is not luck — it is the result of hold points witnessed by someone who signs.

6 · The handover pack — and the lessons. Handover is a document set, not a handshake: as-builts, test records, punch list closed, training done, warranty clear. Then the part Eaton calls **continuous improvement**: what went wrong, what we would do differently, and what the next project should copy. I build the templates and dashboards that make that sharing happen instead of being remembered.

Safety as a condition of employment and a **zero-incident** culture are not lines I need persuading of; they describe how a site has to be run when the equipment is live. That is also why the **Eaton Business System** way of working — **lessons learned** shared, not stored — is the part of this role I would use most.

I am based in Måløv, twenty minutes from Copenhagen, and 50 % travel between customer construction sites suits me; I hold a driving licence and can work and travel across **EMEA**. Languages: professional English, native Danish, Persian. I can start at short notice.

Kind regards

Shahram Ajloo

SHAHRAM AJLOO

Data Center Project Manager · Power, commissioning and handover

+45 93 99 95 14 · ajlooshahram@gmail.com · linkedin.com/in/shahramajloo · Copenhagen area

PROFILE

Project and commissioning manager with twenty years in **critical infrastructure**: authorised marine and mechanical engineer at **LV/MV/HV** level, electrical and mechanical design (EQF 6) and a B.Tech in technology management. 37 concurrent CAPEX projects with schedule, budget and **forecast** in SAP ERP, 11 contracts with a team of 14, FAT/SAT and IQ/OQ/PQ with zero critical findings, plus full P&L since 2023.

POWER, COMMISSIONING AND HANDOVER

- **Electrical systems:** Switchgear, panel and power distribution work up to high voltage; UPS, emergency and escape lighting, fire alarm and access control, automation and SCADA interfaces.
- **Commissioning and SAT:** FAT/SAT protocols written before the test, IQ/OQ/PQ documentation, acceptance criteria agreed with the customer; findings closed by root cause, not by explanation.
- **Handover:** Handover packs with as-builts, test records and punch list closed; training delivered and warranty handover agreed — zero critical findings at acceptance.

SCHEDULE, RISK AND COST CONTROL

- **Schedule and look-ahead:** Eight-to-twelve week look-ahead with dependencies and hold points; weekly review and daily site reporting. MS Project and Monday in daily use.
- **Risk and mitigation:** Risk register with owner, trigger and date; outages planned into narrow windows with temporary solutions designed in advance, proven in 24/7 operation.
- **Cost, margin and variations:** Budget and forecast monthly in SAP ERP on 37 projects; variations priced, owned and approved in the week they arose; full P&L in own company since 2023.

TEAM LEADERSHIP AND STAKEHOLDERS

- **Teams, internal and external:** 25 specialists across engineering, procurement and operations; a 14-person contract team; written mandates, not verbal ones.
- **Single point of contact:** One voice for the customer on site: daily progress updates, decisions recorded, and bad news delivered with a plan rather than an apology.
- **Site safety:** LOTO, risk assessment at mobilisation, safety walks and near-miss follow-up; briefings before every shift change on live plant.

EXPERIENCE

Owner / Technical Director — ELOHVAC ApS · Copenhagen · May 2023–present

Scope: 5 electricians + 3 apprentices · full P&L · design, installation and handover

- **Delivery and commercial responsibility:** Projects from quotation to handover with own budget and own risk; subcontractors, material control and QA — and the decision to decline work that would not carry.

Senior Commissioning Engineer / Project Manager — Novo Nordisk A/S · Kalundborg / Bagsværd · Nov 2022–Jul 2024

Scope: Electrical systems · 37 concurrent CAPEX projects · 25 specialists · GMP/FDA/EMA

- **Commissioning in a regulated plant:** Project basis, milestones and monthly reporting in SAP ERP; FAT/SAT and IQ/OQ/PQ with protocols written before the test — zero critical findings at handover.

Project and Workshop Manager — Ventek-Air · Copenhagen · Jan 2022–Nov 2022

Scope: 14 employees · 11 concurrent contracts · DKK 2–10 m each

- **Parallel delivery under pressure:** Daily board meetings and bottleneck analysis; crews and suppliers moved between jobs when one ran behind, with the customer informed the same day.

Maintenance and Operations Manager — Biofos (Lynetten) · Copenhagen · Aug 2017–Jan 2022

Scope: Treatment plant in 24/7 operation · pumps, HVAC, HV switchgear, SCADA

- **Live plant, planned outages:** Preventive maintenance and fault-finding around the clock; outages planned into narrow windows, temporary solutions ready before they were needed. LOTO and APV.

Electromechanical Technician / Production Team Leader — ARJ Engineering · Tehran · Dec 2003–Mar 2010 · 12 mechanics and technicians

EDUCATION AND AUTHORISATION

Authorised Marine and Mechanical Engineer — Danish electrical authorisation LV/MV/HV · Danish Safety Technology Authority · May 2023

B.Tech, Technology Management and Mechanical Engineering (EQF 6) · Copenhagen School of Marine Engineering & Technology Management · 2017–2022 · GPA 7.6/12

Electrical and Mechanical Design, Electrical Engineering (EQF 6) · Tehran Technical University · 2000–2003

Refrigeration and HVAC (AMU) · Lean: 5S, PDCA, VSM, A3 · Mercantec · 2021 · STCW safety certificates (2021–2023)

LANGUAGES, PRACTICALITIES AND REFERENCES

English: professional, written and spoken · **Danish:** native · **Persian:** native · **Based in Måløv**, 20 minutes from Copenhagen · **Driving licence B**, able to travel across **EMEA** · **Available at short notice** · References on request.

FIRST 90 DAYS — FROM HANDOVER OF THE FILE TO THE FIRST HANDOVER TO THE CUSTOMER

Period	What happens, and how it is measured
Week 1–2	Read the live projects in the portfolio: scope baseline, schedule, risk register and the last approved variation on each. Walk two sites with the engineers and the customer's representative.
Day 30	Own one project end to end: look-ahead agreed with the customer, hold points defined, and the interface list — switchgear, UPS, batteries, DCIM — signed off by all parties.
Day 60	Weekly cost and forecast review in the EMEA format; variation log live on every active project, and a SAT script written for the next commissioning window.
Day 90	First handover completed to the customer's acceptance, with test records, punch list closed and lessons written into the next project's plan.

A SAT SCRIPT IS WRITTEN BEFORE THE EQUIPMENT ARRIVES

The moment to decide what "tested" means is when the equipment is still in the factory, not when the site is full of people waiting for a signature. So the acceptance criteria are agreed with the customer first, the test protocol is written from those criteria, and the witnesses are booked before the window opens. I have written protocols that later had to be defended in an audit; the ones that survived were the ones written first.

MISSION-CRITICAL MEANS PLANNING THE OUTAGE, NOT THE RECOVERY

On a plant that must not stop, you do not plan the repair — you plan the outage: which loads move, which bypass is in place, who signs the switching schedule, and what happens if the temporary supply fails at 03:00. That thinking is what a live data hall needs during a **commissioning** window, and it is the part of my background I trust most: four years of 24/7 operation where the fallback was designed before it was needed.

THE LONGEST LEAD TIME IS THE ONE NOBODY BOOKED

Switchgear, transformers and batteries are not bought when the site is ready; they are booked when the order is confirmed, and the delivery slot is the real start date of the **commissioning** plan. So the procurement list is built backwards from the energisation date: factory witness test booked, shipping slot confirmed, storage and lifting capacity on site agreed with the **customer**, and the access route checked against what actually arrives. The projects that run late are rarely the ones with the hardest engineering — they are the ones that discovered a 16-week lead time in week two.

THE INTERFACES ARE WHERE THE MARGIN GOES

Most of the money on an **engineered-to-order** project is not lost in the equipment; it is lost in the interfaces between packages — a control signal nobody owned, a battery room dimension that moved, a **DCIM** point list that arrived after the panels were built. Naming those interfaces early, in writing, with an owner for each, is unglamorous work that shows up directly in **margins** and in how calm the last month of a project feels.

WHAT THE ROLE REQUIRES — WHAT I HAVE DELIVERED

Requirement in the posting	Evidence
Bachelor's or Master's degree (or equivalent) in Electrical Engineering	Authorised marine and mechanical engineer (LV/MV/HV), electrical and mechanical design (EQF 6), B.Tech in technology management.
Accredited project management certification with construction site focus	The posting asks for the certificate; the practice behind it is 37 CAPEX projects, 11 contracts and full P&L with site responsibility. I will take the certification Eaton standardises on.
Minimum 5 years' construction site management, ideally hands-on data centre projects	Twenty years on site: 11 concurrent contracts with 14 people, 37 projects in a regulated plant, and own contracting business since 2023.
Experience in large industrial projects with automation and controls	Automation, controls and SCADA in 24/7 operation and in CAPEX delivery; panel and power distribution design up to high voltage.
Strong electrical engineering background and training in data centre technologies	High-voltage switchgear, UPS, emergency lighting, fire alarm, access control and power distribution; cooling and HVAC from refrigeration training and site practice.
Experience with Power Management, Power Control, Mission Critical or BMS systems	Mission critical plant operation with SCADA and building controls; power management and load priority in live 24/7 systems.
Professional level of English	Professional written and spoken English; native Danish; engineering documentation produced in English for international projects.
Driving licence and able to work and travel within EMEA without restrictions	Driving licence B; based 20 minutes from Copenhagen; able to travel 50 % and across EMEA.
Advanced expertise with knowledge of the data centre industry or similar technologies	Critical infrastructure rather than data centres specifically: GMP-regulated production and a 24/7 treatment plant — same regime, same consequence of downtime.
Proven ability to lead and manage internal and external teams	25 specialists led across engineering, procurement and operations; 14-person contract team; subcontractors and suppliers managed contractually.
Strong communication and stakeholder management skills	One voice for the customer on site: daily updates, decisions recorded, and bad news delivered with a plan.
Lead end-to-end execution from purchase order to handover, covering design, procurement and implementation	End-to-end in own company and on 37 projects: project basis, procurement, site delivery, commissioning, handover.
Build and manage project teams and organise kick-off and regular meetings	Kick-offs with scope baseline and interface list; weekly schedule and cost reviews; daily board meetings during delivery.
Develop and maintain schedules and risk registers with proactive mitigation	Look-ahead of 8–12 weeks with hold points; risk register with owner, trigger and date; outages planned into narrow windows.
Control project costs and margins, manage variations and provide accurate forecasts	Budget and forecast monthly in SAP ERP on 37 projects; variations priced and approved in the week they arose; full P&L since 2023.
Act as single point of contact for on-site implementation including SAT scripts and commissioning	Single point of contact on site for customer, contractor and own crews; SAT protocols written before testing; IQ/OQ/PQ documentation.
Ensure project success across safety, customer satisfaction, financial performance and timing	LOTO, risk assessment and safety walks on every mobilisation; zero critical findings at acceptance; projects closed within budget and on the agreed date.
Drive continuous improvement by sharing lessons learned and recommending better practices	Templates, checklists and dashboards built and shared; 40 % less administration from own AI tools; lessons learned written into the next project plan.

WHERE I WOULD START

With the file, not the site. First week: read the scope baseline, **schedule** and **risk register** of every live project in the portfolio and mark where the three disagree — because that is where the next surprise is booked. Then walk the two nearest sites with the customer's representative and the installation team, and check the interface list against what is actually on the floor. After that, the first conversation about **commissioning** dates is worth having.
