6 November 2026

AIRE Copenhagen · Hands-on Maintenance Supervisor

Application: Hands-on Maintenance Supervisor, AIRE Copenhagen

For the attention of Jan Hoffmann, Senior Recruitment Specialist, Career

A guest at AIRE never sees the plant room. They notice the water, the temperature and the air — and if any one of those is wrong, they notice nothing else. That is the standard the maintenance team is measured against, and it is a standard built out of boring things done on time: the dosing checked before the first guest, the filter cleaned before it is due, the pump that was replaced in February instead of failing in July. I have spent twenty years doing exactly that, half of it with a spanner in my hand.

I would run the maintenance of a site like AIRE on four fixed things. First **the plant room decides the guest experience**: pool chemistry, water temperature and air handling are measured on a schedule and logged, so the first sign of drift is a number on a sheet — not a complaint at reception. Second **preventive maintenance is a calendar, not an intention**: every asset gets a task, a frequency and a name, and the plan survives a busy weekend because it is planned around the weekend rather than apologised for afterwards. Third **a supervisor works alongside the team**: four technicians need clear priorities at the start of the shift, feedback on the spot and a supervisor who takes the awkward job rather than handing it out. Fourth **routines should improve because somebody owns them**: the same failure twice is a system problem, and the fix is usually a checklist, a stock level or a spare part — not more effort.

I am a practical engineer, not a paper one. I trained as an **electromekaniker**, I am a **state-authorised marine engineer (LV/MV/HV)** with a **B.Tech in technology management and mechanical engineering**, and since 2023 I have run my own technical company, **ELOHVAC**, with **five electricians and three apprentices** and full P&L responsibility. That means I have done the fault-finding myself: panels, motors, pumps, valves, controls and the low-voltage work that has to be done properly the first time.

Leading a small technical team is what I have done for most of my career. At **ARJ Engineering** I was production team leader for **twelve mechanics and technicians** in a machine shop — shift planning, onboarding, training and follow-up on the individual. At **Ventek-Air** I led **fourteen employees and eleven parallel projects** with a daily stand-up and priorities that were re-set the same day when a machine or a person dropped out. I have also stood in for the person above me, which is a bigger part of a supervisor role than the job description usually admits.

Water and 24/7 plant is where I would bring something specific. For five years I was maintenance and operations manager at **Lynetten (Biofos)**, a critical process plant running around the clock: pumps, blowers, dosing, filtration, valves, transformers, switchgear and SCADA, with condition-based maintenance, a criticality list, spare parts, external fitters and an **on-call rota** that I both planned and worked. Standards, 5S and PDCA on the workshop and stores; measured results, including **more than 40 % lower energy consumption** documented on the plant.

What attracts me to AIRE is the combination of a guest-facing standard and a technical site that has to be kept quiet: a close-knit team of around thirty, direct contact with management, a site in the old Carlsberg brewery buildings where the building itself is part of the product — masonry, heat, humidity, and a plant that has to work quietly inside it — and maintenance where the quality is felt by guests in the water rather than read in a report. I have worked in environments where a stop was measured in hours; here the measure is whether a guest notices anything at all. I am also looking for a place to grow as the site and the company grow: career growth inside an international group is worth more to me than a title.

I am applying for a supervisor role on purpose. I have run a company and carried a manager title; what I want now is a site, a team of four and a standard that is judged by guests every single day. Close enough to the work that I can put my hands on it, and steady enough that the routines can actually be built and kept. The title matters less to me than the size of the job.

Practical: I live in Måløv, about twenty-five minutes from central Copenhagen, with a **driving licence and my own car**, so I can be on site promptly for an on-call issue. I am flexible with the **weekend shift every other weekend**, with evenings, public holidays and holiday cover, and I am comfortable with the on-call arrangement — I have carried a phone for a plant before. I communicate confidently in **English** and Danish, and I can start by agreement. I would like to hear how the preventive plan is built today and where the team loses most of its time — that is where I would begin.

Kind regards

Shahram Ajloo

SHAHRAM AJLOO

Maintenance Supervisor · Hands-on leadership of plant, people and preventive maintenance

PROFILE

Hands-on maintenance supervisor with 20+ years in technical operations, plant and workshops — state-authorised marine engineer (LV/MV/HV), B.Tech in technology management and mechanical engineering, and a trained electromekaniker. Five years of 24/7 plant maintenance with pumps, dosing, filtration, ventilation, switchgear and SCADA, an on-call rota and documented results including over 40 % lower energy. Has led twelve mechanics, fourteen employees and, since 2023, an electrical company with five electricians and three apprentices and full P&L — working in the tool belt alongside the team. Practical, precise, and used to an invisible technical site.

PLANT, MAINTENANCE AND PEOPLE

- **General maintenance, hands-on:** Electrical, mechanical, plumbing, ventilation and building systems handled first-hand: fault-finding on panels, motors, pumps, valves and controls, plus the low-voltage work that has to be done right the first time.
- **Preventive maintenance:** Task, frequency and owner for every asset; condition-based maintenance and a criticality list, so the work that prevents a failure is planned before the failure sets the agenda.
- **Water and pool systems:** Five years with pumps, dosing, filtration, valves and water quality on a 24/7 process plant: measurement on a schedule, logging, corrective dosing and the discipline of never letting a reading slide.
- **Leading a small team:** Twelve mechanics in a machine shop, fourteen employees at Ventek-Air and eight in my own company — priorities at the start of the shift, onboarding, training, development, feedback and cover when someone is away.
- **On-call and emergencies:** Planned and worked an on-call rota on a critical plant: first response to an urgent issue, making the site safe, calling the right fitter or supplier and writing it down afterwards.
- **Stock, spares and routines:** Criticality-based stock of spares, materials and consumables, 5S in the workshop and stores, and routines that get improved because the same failure twice is treated as a system problem.

TOOLS, SYSTEMS AND METHODS

Area	Documented use
Plant and assets	Asset register with criticality, maintenance plans per unit, spare-parts needs and documentation of every service carried out.
Water and air	Measurement and logging of water quality, temperature and flow; ventilation and air handling from project work and service; corrective dosing and follow-up.
Electrical and controls	LV/MV/HV authorisation, panels and switchgear, motors and drives, sensors and SCADA; fault-finding from the symptom to the component.
Planning, data and follow-up	Daily and weekly plans, stand-up meetings and priorities re-set the same day; Excel, Power Query and Python for checklists, logs and dashboards with before-and-after results.
Safety and compliance	Health and safety instructions, risk assessment, permits and documentation; 5S and standard work on a 24/7 plant with authority requirements.

PROFESSIONAL EXPERIENCE

Owner / Technical Director — ELOHVAC ApS · Copenhagen · May 2023–present

Scope: 5 electricians and 3 apprentices · full P&L · electrical service and contracting

- **Running the work and doing it:** Sales, quotations, purchasing, invoicing and payment follow-up with full P&L; daily operations with customers, employees and suppliers — and in the tool belt when the job has to be delivered; own Python/Claude tools for checklists and KPIs with over 40 % productivity gain.

Senior Commissioning Engineer / Project Manager, Electrical Systems — Novo Nordisk A/S · Kalundborg/Bagsværd · Nov 2022–Jul 2024

Scope: 37 parallel capital projects · 25 specialists · DKK 2–10 m per project · GMP/FDA/EMA

- **Technical acceptance and documentation:** Specification, factory and site acceptance testing (FAT/SAT) and IQ/OQ/PQ for new production equipment; progress, cost and risk reported monthly; zero critical findings at audited handover.

Project and Workshop Manager — Ventek-Air · Copenhagen · Jan 2022–Nov 2022

Scope: 14 employees · 11 parallel projects · DKK 2–10 m per assignment

- **Ventilation, coordination and short horizons:** Daily stand-ups, capacity and bottleneck analysis and priorities re-set the same day when a machine or a person dropped out; subcontractors and handover packages driven to date.

Maintenance and Operations Manager — Lynetten (Biofos) · Copenhagen · Aug 2017–Jan 2022

Scope: Critical 24/7 process plant · pumps, blowers, dosing, filtration, ventilation, transformers, switchgear and SCADA

- **Plant, water, fitters and on-call:** Maintenance, repair and spare parts coordinated with mechanics and external fitters around the clock; condition-based maintenance and criticality; 5S and standard work in workshop and stores; on-call rota planned and worked; energy management with over 40 % lower consumption documented.

Electromechanic / Production Team Leader — ARJ Engineering · Tehran · Dec 2003–Mar 2010

Scope: 12 mechanics and technicians · machine shop · industrial equipment

- **Workshop, faults and shift cover:** Preparation, repair and fault-finding on industrial equipment with turning, milling, welding and assembly; shift planning, onboarding and follow-up on targets for 12 technicians.

EDUCATION AND AUTHORISATION

B.Tech, Technology Management and Mechanical Engineering · Copenhagen School of Marine and Technical Engineering · 2017–2022 · GPA 7.6/12

State-authorised Marine Engineer (LV/MV/HV) · Danish Safety Technology Authority · May 2023

Electrical and Mechanical Construction, Electrical Engineering · Tehran Technical University · 2000–2003 · EQF 6

Refrigeration and Ventilation Technology • STCW · Mercantec 2021 · Danish Maritime Authority 2021

LANGUAGES, PRACTICALITIES AND REFERENCES

English: professional, spoken and written · Danish: native · Persian: native · Driving licence B and own car · Måløv, about 25 minutes from central Copenhagen, able to reach the site promptly · Flexible with weekends, evenings, public holidays and holiday cover · On-call experience from a 24/7 plant · Available by agreement · References on request.

WHAT THEY ASK FOR — WHAT I HAVE

Requirement	Evidence
Practical, very hands-on, broad technical skills	Trained electromekaniker, authorised marine engineer LV/MV/HV and owner of an electrical company where I do the fault-finding myself; electrical, mechanical, plumbing and ventilation work handled first-hand, and I work independently and take ownership of the site.
Around two years of maintenance experience	Five years as maintenance and operations manager on a critical 24/7 plant, plus twenty years of technical operations, workshops and service in total.
At least one year leading or coordinating a small team	Twelve mechanics and technicians in a machine shop, fourteen employees at Ventek-Air and eight in my own company — onboarding, training, feedback and daily priorities.
Electrical work, plumbing, building maintenance or similar	Electrical work with authorisation at LV/MV/HV; plumbing and pipe systems on pumps, valves, dosing and filtration; building and installation work in electrical contracting and ventilation projects.
Pool or water treatment experience	Five years measuring and correcting water quality on a process plant: dosing, filtration, sampling, logging and the discipline of catching a drift before it becomes a problem.
Preventive maintenance to procedures and H&S requirements	Maintenance plans per asset, condition-based maintenance and criticality, 5S and standard work, and health and safety instructions with risk assessment and documentation.
Coordinating with other departments and stock control	Maintenance needs agreed with production, projects and suppliers; criticality-based stock of spares and consumables kept in the workshop and stores.
Improving maintenance routines over time	Routines rebuilt and measured: over 40 % productivity gain from checklists and automated follow-up, and energy consumption cut by more than 40 % on a 24/7 plant.
Focused, detail-oriented and clear with guests and colleagues	Fault-finding from symptom to component with attention to detail and the documentation to match; clear communication and handovers in Danish and English, to technicians, managers and guests.
Comfortable with on-call and reaching the site promptly	On-call rota planned and worked at Lynetten; lives in Måløv about 25 minutes from central Copenhagen, with a driving licence and own car.

THE FIRST 90 DAYS — THE PLANT, THE TEAM AND THE ROUTINES

Period	What happens, and how it is measured
Weeks 1–2	Walk the site with the Facilities Manager and the four technicians: plant room, pool and water systems, air handling, electrical rooms and stores. Read the last twelve months of maintenance records, faults and supplier invoices to see what actually breaks and how often.
Day 30	A maintenance plan per asset with task, frequency and owner; the daily priority routine agreed with the team; water readings and temperatures logged on a fixed schedule; stock list for the parts that stop the site, checked against the shelf.
Day 60	Preventive work scheduled around weekends and holidays instead of colliding with them; clear ownership of each area among the four technicians; the two most frequent failures addressed with a checklist or a spare part rather than more effort.
Day 90	Reactive work and downtime measured month by month, with reporting to the Facilities Manager; a simple routine for suppliers and external fitters; and a short list of improvements with cost and effect, so the next quarter is chosen rather than discovered.

THE GUEST NEVER SEES THE PLANT ROOM — THAT IS THE JOB

Everything that makes a bath house work is hidden behind a door that guests never open: pumps, filters, dosing, heat exchangers, air handling, drains and the electrical boards that feed them. When it works, nobody notices it, and when it fails, everybody notices within minutes. A maintenance supervisor is therefore judged on the days nothing happens — and those days are made in advance, with a plan and a set of readings rather than luck.

WATER IS THE ONE SYSTEM YOU CANNOT ARGUE WITH

Water quality is chemistry and time: dosing, filtration, circulation, cleaning and disinfection, and temperature, checked on a schedule and written down. A reading that is slightly off is not a problem yet — it is a warning, and the job is to act on the warning rather than on the complaint that follows it. I have spent five years measuring, logging and correcting water on a plant that ran around the clock, and I know that the difference between a stable pool and a recurring problem is almost always the frequency of the checks.

A PREVENTIVE PLAN IS A CALENDAR, NOT AN INTENTION

Everyone agrees that preventive maintenance matters, and it is still the first thing that gets moved when a weekend is busy. The only way it survives is if it is in the calendar with a name against it, planned around the busy periods rather than apologised for afterwards — and if the completion is visible, so the plan is a fact rather than a document. That is how I ran maintenance on a plant where a stop cost far more than the service would have.

FOUR TECHNICIANS AND ONE ON-CALL PHONE — THE ROTA IS THE JOB

A small team covering a site that is open all year works only if the rota is fair, known in advance and actually staffed: every other weekend, early and late shifts, holidays and the phone at night. It is also the part of the job where a supervisor earns trust fastest — by taking the unpopular shift, by being reachable, and by making sure a person who covered last weekend is not the one covering the next.

STOCK AND SPARES: THE CHEAPEST FIX IS THE ONE ON THE SHELF

Most emergency call-outs end with a part somebody had to fetch. A short, criticality-based stock list for the pumps, valves, seals, sensors and fuses that stop the site is cheaper than the downtime and the overtime it prevents. I have built that list before, and I keep it honest by reviewing what was actually used rather than what somebody thought would be needed.

A SUPERVISOR SHOULD BE THE FIRST ONE IN THE PLANT ROOM

The technicians decide whether the supervisor is credible in the first month, and they decide it on whether he takes the unpleasant job. I have cleaned strainers, traced faults in a plant room at three in the morning and carried the tools; that is not team leadership theory, it is the reason people accept a decision when the shift gets difficult. My job is to make the team able to do the work without me, and then to be there anyway.

I HAVE CARRIED THE PHONE BEFORE

At Lynetten I planned and worked the on-call rota for a critical plant: first response, making the situation safe, calling the right fitter or supplier and writing it down afterwards so the same night did not happen twice. That experience is why I am comfortable with the flexibility this role asks for — weekends, late shifts, holidays and the phone — and why I would rather build the routine that prevents the call than be praised for answering it.
