4 November 2026

Vertiv · Project Manager, Norway/Nordics · Site based in Drangedal or Kristiansand

**Application: Project Manager – Norway**

Dear Vertiv Northern Europe team,

**The last week of a data centre project is decided in the first one.** Not in the commissioning window, and not in the conversation about who caused the delay: in the week where the site is opened, the accesses are agreed, the contractors are briefed and someone writes down who owns the next step. Below is that week as I run it on a customer site in **Norway** — Monday morning to Friday afternoon, with the evidence after each day.

**Monday, 06.40.** On site before the first crew. I walk the route with the customer's site manager and the main contractor's supervisor: where material is laid down, where the isolation points are, which doors are locked at 16.00, and where the **switchgear**, the **UPS** and the **busbar** run sit relative to the cooling. The week's plan is one page, agreed before lunch, with one owner per line. That is what **Own it** looks like on a site: a name, not an intention.

**Tuesday, 08.00.** Installation starts. **Technical drawings** and **schematic**s against the floor as built: what can go in as drawn, and what needs an answer today. Two lists, both written before 11.00 — the questions go to the designer and the customer the same afternoon, because a question asked on Thursday has already cost two days. Materials, lifting, cable routes and clearances are checked against the **daily progress updates** the customer will read at 16.00.

**Wednesday, 14.10.** Something does not arrive. The delay is not the problem; the silence is. The escalation path was agreed on Monday, so the call goes out while there is still time to re-sequence: which crew can work, which delivery can be split, and which part of the programme can move without touching the **commissioning** date. Decision recorded, customer informed before they ask. **Act with urgency** means the same hour, not the same week.

**Thursday, 09.30.** Start-up and **testing**. The sequence is fixed: pre-checks, torque and terminations, insulation and continuity, energisation, witness. Every step has an acceptance criterion and a signature. On critical power nothing is energised because it is Thursday; it is energised because the test before it passed and the person who signed it is standing there.

**Friday, 15.00.** The customer meeting. Punch list closed or dated, the weekly report in writing, next week's look-ahead agreed with the contractor and the customer's **on-site representative** in the room. Then the part Vertiv calls **continuous improvement**: what cost us a day this week, and what the next site should copy. Transparent and open communication is not a value on a wall when the report says the truth about a bad Wednesday, and a **high-performance** culture is measurable on site by one thing: whether Thursday's test passes the first time.

**That week is not a template I have read about.** Twenty years on site: 37 concurrent CAPEX projects with schedule, budget and forecast in SAP ERP; eleven contracts running at once with a team of 14; five electricians and three apprentices in my own company since 2023 with full P&L; and four years responsible for a plant in 24/7 operation, where the only acceptable outage was a planned one.

**AC power and thermal are both on my record. UPS**, emergency and escape power, high-voltage **switchgear**, panels and distribution up to high voltage — and, from Ventek-Air and my refrigeration and HVAC training, ventilation and cooling delivered on contract: dimensioning, **installation**, balancing, handover. A data hall is those two systems arguing over the same square metres, and someone has to settle it on the floor.

**Keeping critical systems online no matter what** is the sentence your customers are actually paying for. On a site that means availability designed in: redundant paths that are genuinely separate, cooling that can be serviced without shutting the room, and a handover pack that tells the next engineer which breaker feeds what. That is the part of delivery I care about — not the day the equipment arrives, but the year afterwards when nothing has stopped.

**Practicalities.** Based in Måløv, twenty minutes from Copenhagen Airport and about 1 h 20 from Oslo; **driving licence** B; willing to travel across **Norway** and the **Nordics** and to be on site from day one for as long as a mobilisation needs. **Fluent English**; native Danish, a **Nordic language**, and Norwegian read and understood on site. I hold permanent residence in Denmark, and the Norwegian work permit that follows an offer is a process I will run with your HR alongside the mobilisation, not after it.

Kind regards

Shahram Ajloo

# SHAHRAM AJLOO

**Project Manager · AC power, thermal and commissioning on customer sites**

+45 93 99 95 14 · ajlooshahram@gmail.com · linkedin.com/in/shahramajloo · Copenhagen area

## PROFILE

Site-based project manager in **critical infrastructure**: authorised marine and mechanical engineer at **LV/MV/HV** level, **electrical engineering** and mechanical design (EQF 6), B.Tech in technology management. Twenty years of **planning**, installation, start-up, **commissioning** and **handover** on live sites; 37 concurrent CAPEX projects; eleven contracts with a team of 14; full P&L since 2023.

## SITE DELIVERY

- **Mobilisation:** Access, laydown, isolation points, RAMS and permits agreed before the first crew arrives; a one-page week plan with one owner per line.
- **Contractors and crews:** Subcontractors steered on the floor, not from a site office; 14-person contract team; five electricians and three apprentices; toolbox talks before every shift.
- **Reporting:** Daily progress updates in writing, weekly look-ahead agreed with customer and contractor, decisions recorded and dated so nobody re-argues them.

## AC POWER, THERMAL AND CONTROLS

- **Power:** UPS, emergency and escape power, HV switchgear, panels and distribution up to high voltage; energisation sequences, torque control and witness points per step.
- **Cooling:** Ventilation and HVAC delivery with 14 people and 11 contracts at Ventek-Air; refrigeration and HVAC (AMU); dimensioning, installation and balancing on site.
- **Controls:** SCADA, BMS and automation interfaces; alarm lists, escalation paths and what a site does in the first fifteen minutes.

## RESPONSE AND ESCALATION

- **Response time:** Escalation path agreed before the first shift; a call at 16.30 gets a decision, not a promise. Customer hears bad news from us first.
- **Live plant:** Four years of 24/7 operation: outages planned into narrow windows with the fallback designed before it was needed.
- **Documentation:** Technical drawings and schematics marked up as built; test records and handover packs that stand up in an audit.

## EXPERIENCE

**Owner / Technical Director** — ELOHVAC ApS · Copenhagen · May 2023–present

**Scope:** 5 electricians + 3 apprentices · full P&L · installation and handover

- **Site delivery and commercial risk:** Projects from quotation to handover with own budget and own risk; subcontractors, materials and QA — and the discipline to decline work that cannot be delivered.

**Senior Commissioning Engineer / Project Manager** — Novo Nordisk A/S · Kalundborg / Bagsværd · Nov 2022–Jul 2024

**Scope:** Electrical systems · 37 concurrent CAPEX projects · 25 specialists · GMP/FDA/EMA

- **Start-up, testing and acceptance:** Project basis, milestones and monthly reporting in SAP ERP; FAT/SAT and IQ/OQ/PQ with protocols written before the test — zero critical findings at handover.

**Project and Workshop Manager** — Ventek-Air · Copenhagen · Jan 2022–Nov 2022

**Scope:** 14 employees · 11 concurrent contracts · DKK 2–10 m each · ventilation and cooling

- **Thermal delivery under pressure:** Daily board meetings and bottleneck analysis; crews and suppliers moved between contracts when one ran behind, with the customer informed the same day.

**Maintenance and Operations Manager** — Biofos (Lynetten) · Copenhagen · Aug 2017–Jan 2022

**Scope:** Treatment plant in 24/7 operation · pumps, HVAC, HV switchgear, SCADA

- **Live plant, planned outages:** Preventive maintenance and fault-finding around the clock; outages planned into narrow windows with temporary solutions ready before they were needed. LOTO and APV.

**Electromechanical Technician / Production Team Leader** — ARJ Engineering · Tehran · Dec 2003–Mar 2010 · 12 mechanics and technicians

## EDUCATION AND AUTHORISATION

**Authorised Marine and Mechanical Engineer — Danish electrical authorisation LV/MV/HV** · Danish Safety Technology Authority · May 2023

**B.Tech, Technology Management and Mechanical Engineering (EQF 6)** · Copenhagen School of Marine Engineering & Technology Management · 2017–2022 · GPA 7.6/12

**Electrical and Mechanical Design, Electrical Engineering (EQF 6)** · Tehran Technical University · 2000–2003

**Refrigeration and HVAC (AMU) · Lean: 5S, PDCA, VSM, A3** · Mercantec · 2021 · STCW safety certificates (2021–2023)

## LANGUAGES, PRACTICALITIES AND REFERENCES

**English:** fluent, written and spoken · **Danish:** native, a **Nordic language** · **Persian:** native · **Based in Måløv**, 20 minutes from Copenhagen Airport, about 1 h 20 from Oslo · **Driving licence B**, ready to travel across **Norway** and the **Nordics** · **Available at short notice** · References on request.

## FIRST 90 DAYS — FROM THE FIRST SITE VISIT TO THE FIRST ACCEPTED DELIVERY

| Period | What happens, and how it is measured |
|---|---|
| **Week 1–2** | Read every live project in the portfolio — schedule, scope, open punch items — and be on the two nearest sites in Norway with the contractors and the customer's representative. |
| **Day 30** | Own one delivery end to end: week plan with one owner per line, an escalation list with names and numbers, and the customer report in Vertiv's format. |
| **Day 60** | Cost and progress reviewed weekly on every project I hold; commissioning dated with witnesses booked, and the punch list empty at the point of handover. |
| **Day 90** | First delivery accepted by the customer, with test records, as-builts and lessons written into the next mobilisation. |

## IN THE FIRST FIFTEEN MINUTES, THE PHONE LIST DECIDES

When something trips at 07.15 on a live site, nobody needs a strategy. They need to know who to call, who can authorise an isolation, and where the spare is. So that list is written at mobilisation, printed, and tested: I ring it once before the first energisation to make sure a human answers. On a plant in 24/7 operation I have been the person on the other end of that call, and it changes how you write the list.

## A COMMISSIONING SEQUENCE IS NOT A CEREMONY

Commissioning has an order for a reason: the test that could fail comes before the energy that could hurt. Pre-checks, terminations and torque, insulation, continuity, then energisation with a witness who signs. When a project is late, the pressure is always to compress that order. The answer is not to compress it — it is to parallelise what can run in parallel and to say out loud, in the meeting, which step will not be skipped and why.

## A SMALL UPGRADE IS NOT A SMALL PROJECT

A two-day upgrade on a live site can stop more than a three-month build, because the build gets a shutdown window and the upgrade has to happen while everything else keeps running. So the small job gets the same treatment: isolation plan, fallback, witness, and the customer's signature before the first cable is touched. The size of the invoice has nothing to do with the size of the consequence — and the customer who watches you take a two-day job seriously is the customer who calls you for the large one.

## WHEN THE CREW BELONGS TO SOMEONE ELSE, AUTHORITY IS WRITTEN

On a customer site the people in front of me often belong to another company. Then authority is not something I assume, it is something agreed at mobilisation: who can call a stop-work, who signs a permit, who speaks to the end customer's operations team, and what happens if the contractor's supervisor and I disagree at 15.00 on a Friday. It goes into the site rules in week one, so that nobody has to negotiate it in the middle of an energisation. Least glamorous document on the site, and the one that prevents the worst meeting.

## TRAVEL IS PART OF THE DELIVERY, NOT A TAX ON IT

Site based in Drangedal or Kristiansand, then across the **Nordics**: that means Monday morning on site, not Monday afternoon at a desk. I plan the travel the way I plan a mobilisation — the week's site days fixed, the admin done outside them, and the crew knowing which day I am physically there and which day I am on the phone at 16.00 with the same information.

## WHAT THE ROLE REQUIRES — WHAT I HAVE DELIVERED

| Requirement in the posting | Evidence |
|---|---|
| **Lead and coordinate project delivery across key customer sites in Norway** | Site-based delivery for twenty years: 11 concurrent contracts with 14 people, 37 CAPEX projects, and own projects as contractor since 2023. |
| **Manage planning, installation, start-up, commissioning and testing** | The full sequence in own company and on 37 projects: planning, installation, start-up, FAT/SAT and IQ/OQ/PQ — zero critical findings at handover. |
| **Act as the company's on-site representative for customers and contractors** | One voice on site for customer, contractor and own crews; daily progress updates in writing and decisions recorded the day they are taken. |
| **Ensure all works meet quality, safety and compliance standards** | LOTO, risk assessment at mobilisation, safety walks and near-miss follow-up; GMP/FDA documentation and KS on regulated sites. |
| **Daily progress updates and clear communication with stakeholders** | Daily written updates and weekly look-ahead agreed with the customer's representative; bad news delivered with a plan, not an apology. |
| **Collaborate with cross-functional teams to deliver on time and within scope** | Cross-functional delivery across engineering, procurement and site; scope held by a written baseline, changes priced before they are built. |
| **Build customer relationships and identify improvement or added value** | Repeat customers in own business and long contract relationships; customer-first in practice means every improvement is offered with a price and a date, so the customer can say yes. |
| **Qualification in electrical engineering or mechanical engineering (degree or equivalent)** | Authorised marine and mechanical engineer (LV/MV/HV), electrical and mechanical design (EQF 6), B.Tech in technology management. |
| **5+ years managing technical or construction projects, ideally critical infrastructure or data centre** | Twenty years: 24/7 plant operation, GMP-regulated build, and own contracting business. Critical infrastructure rather than data halls specifically — same consequence of downtime. |
| **Strong electrical knowledge and experience with AC power and thermal systems** | UPS, emergency power, HV switchgear, panels and distribution; ventilation, HVAC and refrigeration delivered as contracts, including balancing and handover. |
| **Excellent organisational, leadership and communication skills** | 25 specialists led across engineering, procurement and operations; a 14-person contract team; written mandates and one-page week plans. |
| **Read and interpret technical drawings and schematics** | Drawings and schematics read against the floor, marked up as built, and used to raise questions before they become delays. |
| **Microsoft Office and project management tools** | MS Project and Monday for schedule and look-ahead; Excel and SAP ERP for cost and progress; own AI tools for reporting and checklists. |
| **Willing to travel extensively in Norway and the Nordics** | Site based, driving licence B, 1 h 20 from Oslo; travel planned as part of the week, not around it. |
| **Valid driving licence, fluent English, Nordic language an advantage** | Licence B; fluent English written and spoken; native Danish — a Nordic language — with Norwegian read and understood on site. |
| **From smaller upgrades to large-scale builds: AC power, thermal, infrastructure, switchgear, busbar** | DKK 2–10 m contracts to 37-project portfolios; switchgear, distribution, ventilation and cooling. Busbar is the same discipline: torque, clearances, test. |
| **Hands-on role for a strong electrical background; core principles and behaviours** | On the floor, not in a site office. Safety first on every mobilisation, Integrity in the report, Respect for the crew that has to build it, Teamwork with the contractor, and Own it with a name on every line. |
| **Site based in Drangedal or Kristiansand, able to relocate; no visa sponsorship** | Permanent residence in Denmark, 1 h 20 from Oslo, on site from day one. The Norwegian permit that follows an offer is a process I will run with Vertiv's HR alongside mobilisation, not after it. |

## WHERE I WOULD START

On the two nearest sites, with the person who hands over the portfolio. First week: read the open punch items, the last three customer reports and the escalation list of every project I am given, and check that the names on the list still answer their phones. Then walk one site with the contractor and one with the customer's representative — because the gap between those two walks is the whole job.
