Eurowind Energy A/S · Hobro · Technical Asset Performance DK

Application: Technical Operations Manager — Technical Asset Performance DK

To Laurits H Østergaard, Manager, Technical Asset Performance DK

A wind farm is a power plant that nobody is standing next to. That is the whole difficulty of asset performance: the asset does not tell you it is degrading, the data does — and only if someone has decided in advance which number means what, who is watching it, and what happens when it moves. A portfolio of that size is kept reliable by a technical organisation where every asset has a number, every incident has a cause and every shutdown has a plan. That is the work I want to do in Technical Asset Performance DK.

I would run the technical area on four fixed things. First, **every asset has a number and the number has an owner**: availability, production against the expected curve, downtime hours, failure frequency and cost per MWh — built up from infrastructure level to component level, so a gearbox, a transformer or an inverter is not an anonymous part of a site total but an item with a history, a condition and a next action. Second, **an incident is closed when the cause is**: evidence before action, root cause rather than the first plausible explanation, and a check three months later that the same failure has not come back under a different name. Third, **shutdowns are planned backwards from the date**: scope, spare parts, crews, permits, service providers and grid constraints in one plan, with the outage window used for everything that cannot be done live. Fourth, **data nobody uses is not monitoring**: alarm rationalisation, parameters that mean the same thing across sites, and reports that a manager, a service provider and an investor can all read without translation.

The electrical side is where I am strongest. I hold the Danish authorisation for **LV, MV and HV installations**, and at **Lynetten under Biofos** — one of Denmark's largest wastewater plants, in 24/7 operation — I was operations and maintenance manager for an asset base of pumps, blowers, ventilation, **transformers, switchgear, protection and drives**, with **SCADA** on everything that moved. Five years of keeping a plant running that was not allowed to stop taught me the discipline this role is built on: condition before failure, isolation and permits before work, and a fault history that is written down while the fault is happening.

Data and monitoring are not a side interest for me. At Lynetten I ran **energy management on metering and SCADA data** rather than on assumptions: where did the energy go, which assets drew it, and what gave the largest effect per krone — the documented result was **more than 40 % lower energy consumption**, and it held because the follow-up became a routine and not a project. I clean, join and compare operational data in **Python and Excel**, and I build the views that make a portfolio readable: availability, downtime causes, production against expectation, and the trend that says a component is on its way out before it takes the string with it.

Commissioning and integration I have done from the inside. At **Novo Nordisk** I ran **37 parallel capital projects** worth 2–10 million DKK each, with 25 specialists: FAT and SAT, IQ/OQ/PQ, acceptance criteria, punch lists, change control and handover to operations — with **zero critical findings** at audit. I have also supervised contractors through production shutdowns, where the window is fixed, the crews are many and the cost of a day is visible on a chart. An asset is not in operation when the contractor leaves; it is in operation when the data, the documentation and the alarm list agree.

Working with service providers and contractors is a large part of my daily work, and so is the commercial side of it. I have been on both sides of the table — as **project and workshop manager at Ventek-Air** for **14 employees and 11 concurrent jobs**, and as owner of **ELOHVAC** since 2023, where I carry full P&L with five technicians and three apprentices. That is where I learned to read a service contract for what it actually covers, to ask for the failure report rather than the invoice, and to weigh a repair against a replacement with numbers instead of instinct. When I report upward, it is in the language the decision is made in: what it costs, what it risks, and what it earns.

Eurowind says it plainly: **"the wind is never standing still"**, and the culture is one where people speak up and where growing is part of the job. That fits how I work. A technical operations manager who only answers questions is a reporting function; the value is in taking a complex topic — an underperforming string, a recurring converter fault, a maintenance campaign that keeps slipping — from identification to a closed action that someone else can audit.

Practically: I live in Måløv, Hobro is around three hours away by car, and I plan my weeks around the office and the sites, with travel to parks a few times a year as the role requires. I have a **driver's licence (B)**, I work and write **English** professionally, and I am ready to take the **full GWO package** with the onboarding so I can get out to the turbines from the start. I can start by agreement. I would like to hear which parks and which asset types are giving the team the most technical trouble right now — that is where I would begin.

Kind regards,

Shahram Ajloo

SHAHRAM AJLOO

Technical Operations Manager · Asset performance, HV and operations data

+45 93 99 95 14 · ajlooshahram@gmail.com · linkedin.com/in/shahramajloo · Måløv, Denmark

PROFILE

Technical operations and maintenance manager with 20+ years in technical asset management, electrical infrastructure and 24/7 operations — authorised machine and electrical installer (LV/MV/HV) with a B.Tech in Technology Management & Mechanical Engineering. Five years as operations and maintenance manager on a national-scale plant with transformers, switchgear, protection, drives and SCADA, where energy management on metering data delivered over 40 % lower consumption. 37 capital projects commissioned under GMP with zero critical findings; full P&L since 2023. Structured, analytical and commercial about the decisions the data is meant to support.

ASSET PERFORMANCE, HV AND OPERATIONS DATA

- **End-to-end technical asset management:** Asset registers built from infrastructure down to component level, with condition, history, criticality and next action per item; maintenance prioritised by criticality and condition rather than by calendar, so that reliability is a managed outcome and not a hope.
- **Troubleshooting, root cause and incidents:** Fault finding on electrical and mechanical systems with evidence before action: measurements, trend data and history first, then root cause, corrective action and a follow-up that proves the failure did not return.
- **Maintenance planning and shutdowns:** Major maintenance campaigns and production stops planned backwards from the fixed date — scope, spares, crews, permits, service providers and isolation — with the window used for everything that cannot be done live.
- **Commissioning and integration:** FAT/SAT, IQ/OQ/PQ, acceptance criteria, punch lists, change control and handover to operations in 37 capital projects; new assets integrated with documentation, alarm lists and data that agree.
- **Monitoring, data and performance:** SCADA and metering data cleaned, joined and compared in Python and Excel; availability, downtime causes and production against expectation turned into views that operations, service providers and management use — and the basis for continuous optimisation of reliability and output across the portfolio.

TOOLS AND METHODS

Task	Tool and documented use
Electrical assets and HV	Transformers, switchgear, protection, drives and motors in 24/7 operation; authorisation for LV, MV and HV; isolation, LOTO and safe switching as daily practice.
Condition and maintenance	Condition-based maintenance, criticality ranking, spare-part criticality against lead times, vibration and temperature as early indicators, shutdown scope built from the register.
Data and platforms	SCADA, meters and historian data; Python for data analysis — cleaning, joining and comparing — and Excel for the working model; KPI views for availability, downtime and energy.
Commissioning and quality	FAT/SAT, IQ/OQ/PQ, acceptance criteria and punch lists, change control before the change, as-built documentation and handover.
Contractors and service providers	Scope, SLA and reporting requirements set in the contract; failure reports and evidence requested rather than invoices; performance reviewed on the numbers.
Reporting and economics	Monthly reporting to management and customers; cost per unit, OPEX against CAPEX trade-offs, and business cases that survive being questioned; SAP and Excel daily.

EXPERIENCE

Owner / Technical Director — ELOHVAC ApS · Copenhagen · May 2023–present

Scope: 5 technicians and 3 apprentices · full P&L · private and commercial customers

- **Commercial and technical:** Panels, drives and control systems specified, installed, tested and handed over; budget, pricing and supplier terms owned end-to-end, with the customer informed the same day something changes.

Senior Commissioning Engineer / Project Manager, Electrical Systems — Novo Nordisk A/S · Kalundborg/Bagsværd · Nov 2022–Jul 2024

Scope: 37 parallel capital projects · 25 specialists · 2–10 million DKK each · GMP/FDA/EMA

- **Commissioning and handover:** FAT/SAT, IQ/OQ/PQ and acceptance criteria across 37 projects; zero critical findings at audit, and assets handed to operations with documentation that matched the installation.
- **Shutdowns and contractors:** Contractors supervised through fixed production stops; interfaces to other trades and suppliers held to scope, sequence and quality.

Project and Workshop Manager — Ventek-Air · Copenhagen · Jan 2022–Nov 2022

Scope: 14 employees · 11 concurrent jobs · 2–10 million DKK per job

- **Delivery under pressure:** Daily board meetings, bottleneck analysis and re-prioritisation across 11 concurrent jobs; deliveries checked against acceptance criteria before they left the workshop.

Operations and Maintenance Manager — Lynetten under Biofos · Copenhagen · Aug 2017–Jan 2022

Scope: Process plant in 24/7 operation · pumps, blowers, ventilation, transformers, switchgear, drives and SCADA

- **Operations, people and condition:** Shift planning and daily leadership of operations staff; condition-based maintenance and live fault history with the plant running through it.
- **HV, contractors and performance data:** Transformers, switchgear and protection maintained under permit and isolation discipline; contractors and authority requirements managed in a plant that could not stop; energy management on metering and SCADA data with over 40 % lower consumption, documented and sustained.

Electromechanical Technician / Production Supervisor — ARJ Engineering · Tehran · Dec 2003–Mar 2010

Scope: 12 mechanics and technicians · machine workshop · industrial equipment

- **Uptime and root cause:** Shift planning and follow-up on targets; fault finding, root cause analysis and corrective actions on production equipment.

EDUCATION AND AUTHORISATION

B.Tech, Technology Management & Mechanical Engineering · Maskinmesterskolen København · 2017–2022 · GPA 7.6/12

Authorised machine and electrical installer (LV/MV/HV) · Danish Safety Technology Authority · May 2023

Electrical and mechanical engineering · Tehran Technical University · 2000–2003 · EQF 6

LANGUAGES, PRACTICAL AND REFERENCES

Danish: native · English: professional · Persian: native · Driver's licence B · Based in Måløv, Hobro around three hours away, weeks planned around office and sites · Ready to complete the full GWO package · Available by agreement · SAP and Excel daily, Python for data work · References on request.

WHAT THE ROLE ASKS FOR — MY EVIDENCE

Requirement	Evidence
A technical education	Authorised machine and electrical installer (LV/MV/HV) with a B.Tech in Technology Management & Mechanical Engineering; 20+ years in technical operations and maintenance.
Experience within asset management	Asset base of pumps, blowers, ventilation, transformers, switchgear, protection and drives managed in 24/7 operation for five years; asset registers, condition, criticality and cost per unit as the working model.
Wind, BESS, PV and HV	HV, MV and LV assets owned and maintained under authorisation: transformers, switchgear, protection, drives and grid connection, plus commissioning of electrical systems in 37 projects. Asset performance is the same discipline on any generating asset, renewable energy parks included: availability, production against curve, downtime and cost per MWh — applied to a different prime mover.
A hands-on mindset, strong toolbox, autonomous end-to-end	Fault finding on site as well as in the data; panels, drives and control systems installed and tested personally; 37 projects taken from scope to audited handover, and full P&L since 2023 — technical topics owned from identification to closed action.
Troubleshooting, root cause analysis and incident handling	Root cause discipline built in a plant that could not stop: measurements and history first, corrective action documented, and follow-up that confirms the failure has not returned.
Planning and coordinating major maintenance and shutdowns	Condition-based maintenance and shutdown scope in 24/7 operation; contractors supervised through fixed production stops, with one plan, one sequence and one daily coordination.
Commissioning and integration of new assets	FAT/SAT, IQ/OQ/PQ, acceptance criteria, punch lists and handover in 37 projects with zero critical findings; new assets integrated with alarm lists, documentation and data that agree.
Operational data, monitoring platforms and technical reporting	SCADA and metering data analysed in Python and Excel; availability, downtime causes and production against expectation turned into views that are used; monthly reporting to management, customers and other stakeholders, with the numbers documented so an investor question can be answered line by line.
English, driver's licence (B), travel, service providers	English professional in international project environments; licence B and ready to travel to parks a few times a year; service providers and contractors steered by scope, SLA and reporting requirements rather than by invoice.

FIRST 90 DAYS — THE REGISTER, THE CAUSES AND THE DATA

Period	What happens, and how it is measured
Week 1–2	Read the portfolio and the contracts: which parks, which asset types, which service agreements, which numbers are reported today and to whom. Out on site with the surveillance team and with a service provider while they work.
Day 30	A one-page asset view per park — availability, downtime causes, production against expectation, open incidents and their age. The technical topics with the highest cost or repetition ranked, and the first two taken as owner.
Day 60	Two or three recurring failures taken to root cause with documented corrective actions; alarm and parameter conventions compared across sites; the maintenance campaign and the next shutdown scoped backwards from the date.
Day 90	A portfolio view that the team, the service providers and management read the same way; repeat failures falling, downtime causes named rather than summarised, and at least one technical improvement documented before and after so it can be defended to an investor.

AN ASSET IS ONLY AS GOOD AS ITS NUMBER

A portfolio of parks produces an enormous amount of data and very little information unless someone decides in advance what is being measured. Availability without the definition behind it is a number that can be argued about; production without the expected curve is a number without a verdict. My first job in any asset organisation is to make those definitions explicit and comparable across sites, so that a weak asset shows up as a fact and not as an opinion in a meeting.

AN INCIDENT IS CLOSED WHEN THE CAUSE IS

The expensive incident is rarely the first one. It is the same one, three months later, with a different work order number. Closing an incident properly means evidence before action: what the data showed before the trip, what was found on site, what was changed, and how we will know it worked. It also means writing it down while it is happening, because a fault history reconstructed from memory is worth very little when the manufacturer asks a hard question about warranty.

SHUTDOWNS ARE PLANNED BACKWARDS

An outage window is the most valuable hour a technical organisation has, and it is decided weeks before it starts. Scope that needs the turbine stopped, spare parts with the right lead time, crews and permits, service providers on the same sequence, and the grid side agreed — all in one plan, with a named owner per line. If the plan is built forwards from what people happen to be free to do, the window is used on the easy work and the expensive work waits another year.

DATA NOBODY USES IS NOT MONITORING

A dashboard nobody opens is a cost, not a control. Monitoring earns its place when it changes what someone does on Monday: this string is underperforming against its neighbours, this converter has tripped four times in a month, this temperature is drifting. That means alarm rationalisation, parameters with the same meaning on every site, and reports short enough to be read. The same discipline makes investor clarification easy — the number is already defined, the trend is already there, and the answer takes minutes instead of a week of digging.

COMMISSIONING IS WHERE THE COST IS DECIDED

Most of the lifetime cost of an asset is set before it enters operation: what was tested, what was documented, what was left on a punch list and forgotten. I run commissioning as a set of acceptance criteria rather than a sequence of visits — FAT before it ships, SAT on site, the functions proven against the specification, the alarm list agreed with operations, and the documentation handed over in a state that someone can actually use two years later. That is also where a new park or a new turbine type stops being a project and becomes an asset in the portfolio.

THE COMMERCIAL CASE IS A TECHNICAL DECISION

A technical recommendation without a price is a preference. I have carried a P&L and negotiated supply and service contracts, so I know what a day of downtime costs and what a spare part in stock costs to sit there. The question I ask in every asset decision is the same: what does this buy, what does it cost, and what is the probability it is needed? That is the balance this role is asked to hold, and it is the one I am most comfortable defending to a manager, a service provider or an investor.

THE TEAM IS THE ASSET THAT DOES NOT APPEAR IN THE REGISTER

A technical asset organisation runs on people who are allowed to say what they actually think about a machine. I lead by being specific — what we know, what we do not know yet, and who does what by when — and by making sure the person who finds the problem gets the credit for it. Eurowind writes that it wants people to speak up and to grow; in my experience that is built by what a manager does with the first inconvenient piece of information he receives, not by what is written about culture.
