Cavendish Hydrogen ASA · Project Manager, Project & Service · Lind, 7400 Herning

Application: Project Manager, Project & Service — Cavendish Hydrogen

To Dan Østergaard Lauridsen, Director, Projects & Service, EU

A station is not lost on site. It is lost in the handover file. The scope that was never priced, the interface nobody owns, the date the customer thought was agreed — all of it is settled in the weeks between signature and mobilisation, and it only becomes visible fifteen months later, as a claim, a slip in the schedule, or an acceptance that will not close. Four documents decide whether that happens. I have spent twenty years keeping them true, and I would like to do it for your stations.

1. The contract is the project's specification, not its preface. Scope, exclusions, milestone dates, acceptance criteria, the change mechanism and the notice periods — if they are not read at handover, they are discovered at acceptance, by which time every option has a price. I have run **37 concurrent CAPEX projects** of DKK 2–10 million at Novo Nordisk against **GMP/FDA/EMA** requirements, where the delivery package was checked line by line before it left the building, and I have signed both sides of a subcontract in my own company: **11 concurrent contracts**, quotes, terms and the negotiation that follows when the site is not what the drawing said.

2. The baseline is a promise with dates in it. A schedule that everyone agrees with and nobody is staffed for is not a plan; it is a wish with a Gantt chart. At Novo Nordisk I planned 37 projects against one shared pool of 25 specialists, with a monthly cycle, a rolling 12-month capacity view and a **re-forecast** every month, so the date we gave the customer was the date the resources could actually carry.

3. The risk register is the only place where a problem is still free. After it happens, it costs money, schedule or reputation — before, it costs a line and an owner. I have run a critical plant in **24/7 operation** for more than four years, where the difference between a planned intervention and an outage was decided by what had been written down while the week was calm. Every item in my registers carries an owner, a date and a **cost estimate** — including the **opportunities**, which are the half of the register that usually stays empty.

4. The acceptance protocol is written in week one, not in the last week. Commissioning is where a project is judged, and it is also where every undocumented decision comes back. I have taken facilities through FAT/SAT, IQ/OQ/PQ and customer acceptance with **zero critical findings**, closed punch lists with the customer's own inspectors, and handed over documentation that Service could work from on day one.

5. The forecast is the page the customer and the board both read. Cost control is not the invoice; it is the number you commit to in month three and still defend in month fifteen. I have carried **full P&L responsibility since 2023** — margin, hourly rates, utilisation, subcontractor cost and month-end close — and built the reporting that made the number visible before it became a surprise: **SAP ERP**, **Power BI** and **Python**, with **over 40 % productivity improvement** on the routines that used to eat the margin.

6. Service is the project's second customer, and it inherits every shortcut. A **handover to Service** is as-built documentation, spares, alarm lists, maintenance intervals, response times and a technician who has seen the station run. I have received that handover in 24/7 on-call service, so I write it from the side that answers the phone at 03:00.

Hydrogen, plainly. I have not built or commissioned a hydrogen **refuelling station**. What I have done is take technical facilities from documentation to acceptance in environments where a deviation is a finding and a shortcut is an incident — pharmaceutical **process industry** under GMP, water and **energy** infrastructure in 24/7 drift, and electrical installations at MV/HV. The parts that are new to me — 350 and 700 bar, the ATEX zones, purging and inerting, the H2Station sequence — I learn the way I learned GMP: from the engineering, from the test protocols and from the people who built it. What I bring is the discipline that keeps a station on its date while I do.

Lind, Herning — and the distance. I live in Måløv, roughly three hours by car from Herning, and I am used to delivering from a distance: **travel** to sites, suppliers and customers is part of the schedule, not an exception to it, and I hold a driving licence and a car. **English** is my working language in meetings, documentation and on site. **German** is not — I would rather say that here than have it discovered in a customer meeting, and I would put it on the list for the first year.

I would like to know which stations are in the order book today, where acceptance has been hardest to close, and whether **change orders** live in the contract or in a spreadsheet — and I would like to be measured on the four documents: a baseline that holds, a risk register that is used, changes priced before execution, and an acceptance that closes without a discussion about scope.

Kind regards

Shahram Ajloo

SHAHRAM AJLOO

Project Manager, Project & Service · Contract, delivery and acceptance

+45 93 99 95 14 · ajlooshahram@gmail.com · linkedin.com/in/shahramajloo · Måløv

PROFILE

Project manager with 20+ years in delivery, production and contracting — **authorised marine engineer (LV/MV/HV)** and **full P&L responsibility since 2023**. Has carried **37 concurrent CAPEX projects** of DKK 2–10 million with 25 specialists to customer acceptance with **zero critical findings**, coordinated **11 concurrent subcontracts**, run a critical plant in **24/7 operation**, and built cost reporting in **SAP ERP**, **Power BI** and **Python**.

CONTRACT, SCHEDULE AND FINANCIALS

- **Contract handover and scope:** Scope, exclusions, acceptance criteria and change mechanism read at handover, not at acceptance; delivery packages checked line by line before release.
- **Baseline, resources and re-forecast:** 37 concurrent projects planned against 25 specialists and a fixed window calendar; monthly cycle with rolling 12-month capacity view and a new forecast every month.
- **Cost control and margin:** Full P&L since 2023: margin, rates, utilisation and subcontractor cost; month-end close and after-calculation on every project.

COMMISSIONING, QUALITY AND DEVIATIONS

- **Commissioning and acceptance:** FAT/SAT, IQ/OQ/PQ and customer acceptance with zero critical findings; punch lists closed with the customer's inspectors, protocol by protocol.
- **Deviations and traceability:** Every deviation logged, contained and root-caused with A3; documentation handed over as a package Service can use — as-built drawings, spares, alarm lists.

CUSTOMERS, STAKEHOLDERS AND TEAMS

- **Customer interface:** Primary customer contact through execution: weekly site and commissioning calls, monthly steering with logged decisions, and one voice — including when it is bad news.
- **Internal interfaces:** Sales, engineering, procurement and service held to one baseline; supplier lead times fed back into the schedule, not found on site.

PROFESSIONAL EXPERIENCE

Owner / Technical Director — ELOHVAC ApS · Copenhagen · May 2023–present

Scope: 5 electricians + 3 apprentices · full P&L · service, production and small projects

- **Contracts, margin and capacity:** All work delivered under own P&L — quotes and terms negotiated, 11 concurrent subcontracts and supplier agreements managed, staffing across changing addresses, and templates, competence matrix and follow-up built from scratch.

Senior Commissioning Engineer / Project Manager, Electrical Systems — Novo Nordisk A/S · Kalundborg · Nov 2022–Jul 2024

Scope: 37 concurrent CAPEX projects · 25 specialists · GMP/FDA/EMA

- **Projects, schedule and cost at completion:** 37 projects of DKK 2–10 million planned against shared capacity and fixed windows; monthly re-forecast in SAP ERP, cost at completion defended in project reviews.
- **Deviations and acceptance:** Deviations handled with A3 and root-cause analysis; punch closure through FAT/SAT and IQ/OQ/PQ — zero critical findings.

Project and Workshop Manager — Ventek-Air · Copenhagen · Jan 2022–Nov 2022

Scope: 14 employees · 11 concurrent contracts · DKK 2–10 million

- **Production, bottlenecks and forecasting:** 11 concurrent jobs in a 14-person workshop; daily board meetings, weekly capacity adjustment.

Maintenance and Operations Manager — Lynetten under Biofos · Copenhagen · Aug 2017–Jan 2022

Scope: Critical plant in 24/7 operation · pumps, HVAC, HV switchgear, SCADA

- **Maintenance windows, on-call and safety:** Preventive maintenance inside production windows; emergency response around the clock, 5S, spare-parts flow, LOTO and APV.

Electromechanical / production team lead — ARJ Engineering · Tehran · Dec 2003–Mar 2010

Scope: 12 mechanics and technicians · machine workshop · industrial plant

- **Plan and output control:** 12 people planned against the weekly plan with materials and tooling; output measured per person and per machine.

EDUCATION AND AUTHORISATION

Authorised marine engineer — Danish LV/MV/HV authorisation · Danish Safety Technology Authority · May 2023

B.Tech, Technology Management and Mechanical Engineering (EQF 6) · Copenhagen School of Marine Engineering & Technology Management · 2017–2022 · GPA 7.6/12

Electrical and Mechanical Design, Electrical Engineering (EQF 6) · Tehran Technical University · 2000–2003

Lean: 5S, PDCA, VSM, A3, standard work · Refrigeration and HVAC (AMU) · Mercantec · 2021 · applied in capacity control and follow-up

LANGUAGES, PRACTICALITIES AND REFERENCES

Danish: native · English: professional, written and spoken, working language in meetings, contracts and documentation · Persian: native · **Based in Måløv**, three hours from Herning, and travelling to sites, suppliers and customers as the schedule requires · Driving licence and car · Available at short notice · References on request.

THE FIRST 90 DAYS — CONTRACT, BASELINE, ACCEPTANCE

Period	What happens, and how it is measured
Weeks 1–2	Read every live contract: scope, milestones, acceptance criteria, notice periods and change log. Meet engineering, procurement, sales and service; visit a station in commissioning; speak to the customers of the three most difficult projects.
Day 30	One page per live project: baseline date, cost at completion, top three risks, open change orders with owner and value. Everything where the forecast and the contract disagree is flagged to the Director, Projects & Service, EU.
Day 60	Fixed rhythm: weekly site and commissioning call, monthly forecast reviewed with sales, engineering, procurement and service. Change-order log where every item carries a price, a customer reference and a date; acceptance checklist opened at every kick-off.
Day 90	The two nearest projects measurably closer to acceptance with documented punch closure; risk register reviewed with the customer on the largest project; handover-to-Service checklist agreed — as-built, spares, alarms, training, response times.

A COMMISSIONING IS A DOCUMENT BEFORE IT IS A SWITCH-ON

By the time a station is ready to start, the argument about what was included has usually already been had twice. It is decided by whether the acceptance criteria were written into the contract, whether the test protocols existed before the first cable was pulled, and whether the punch list was opened while the trades were still on site. I have closed acceptance that way at Novo Nordisk with the customer's own inspectors in the room, and it is the cheapest week of any project.

THE CHANGE ORDER NOBODY WROTE IS THE ONE YOU FUND

A change is not a claim until someone puts a notice, a price and a date on it — before the work is done. In my own company that discipline is survival: 11 concurrent subcontracts, and every extra ordered from a supplier without a written price is margin that leaves the company quietly. On a station the same rule applies at a different scale: changes are priced when they are identified, agreed with the customer when they are priced, and then executed.

SAFETY IS THE FIRST LINE OF THE SCHEDULE, NOT A PARAGRAPH IN IT

Hydrogen at 350 and 700 bar, hot work, lifting and live electrical work all sit under the same principle: the dangerous activity is planned before it is permitted. I have worked under BEK 1608 with written risk assessments, LOTO and work permits, and I have stopped work on a 24/7 plant when the procedure was not in place. A day lost to a stop is recoverable; a day lost to an incident is not.

A HANDOVER TO SERVICE IS A LIST, NOT A MEETING

Service does not need a presentation; it needs the as-built drawings, the spare-parts list with lead times, the alarm list with priorities, the maintenance intervals, the response times the customer has been promised, and a technician who has seen the station run. I have carried the on-call phone for a critical plant, so I know exactly which of those is missing when a handover is rushed — and it is never the presentation.

WHAT THE ROLE REQUIRES — WHAT I HAVE DELIVERED

Requirement in the posting	Evidence
Leading projects from contract handover to final customer acceptance	37 concurrent CAPEX projects of DKK 2–10 million taken from specification and FAT/SAT to customer acceptance and punch closure — zero critical findings.
Managing project plans, schedules, budgets and resources	Monthly cycle with rolling 12-month capacity view and re-forecast; 25 specialists and 11 concurrent subcontracts planned against the same baseline.
Ensuring contractual compliance and handling project risks and opportunities	Scope, exclusions, notice periods and acceptance criteria tracked from handover; risk registers with owner, date and cost estimate — including priced opportunities.
Driving change orders, claims and commercial negotiations	Change and variation handling in own P&L company: 11 concurrent subcontracts, quotes and terms negotiated, extras priced in writing before execution.
Coordinating site execution, commissioning and customer interfaces	Site coordination under BEK 1608, LOTO and APV with suppliers, subcontractors and the customer's contractors; FAT/SAT and IQ/OQ/PQ run with the customer's inspectors.
Managing project financials, forecasting and cost control	Full P&L since 2023 — margin, rates, utilisation, subcontractor cost, month-end close; cost at completion defended monthly in project reviews and reported in SAP ERP.
Building strong customer and stakeholder relationships	Primary customer contact through execution: weekly site and commissioning calls, monthly steering with logged decisions, and one voice — also when the message is bad.
Ensuring a successful handover to Service	Handover packages with as-built documentation, spares, alarm lists and response times; ran 24/7 on-call service and knows what is missing when a handover is rushed.
Primary customer contact working closely with Sales, Engineering, Procurement, Service, suppliers and subcontractors	Daily interface across sales, engineering, procurement and service; material and supplier lead times fed back into the schedule instead of being found on site.
Delivering safely, on time, within budget and in accordance with contractual requirements and quality standards	24/7 operation and GMP/FDA/EMA delivery: written risk assessments, permits and LOTO; deviations contained, root-caused and closed with A3.
Bachelor's or master's degree in engineering, project management or a related technical field	Authorised marine engineer (LV/MV/HV); B.Tech in technology management and mechanical engineering (EQF 6); electrical and mechanical design (EQF 6).
Experience managing industrial, infrastructure, energy- or EPC projects	Industrial installations and production, energy and water infrastructure in 24/7 operation, pharmaceutical process plant under GMP, and 11 concurrent subcontract packages.
Strong commercial awareness with contract management, change orders and claims	Own company since 2023 with full P&L: contract terms, variations, subcontractor negotiation, margin and cash; after-calculation on every project.
Comfortable managing project budgets, forecasting and cost control	Project budgets of DKK 2–10 million re-forecast monthly; cost at completion, earned hours and utilisation followed in SAP ERP, Power BI and Python.
International environment, confident English, preferably German and willing to travel	English professional as working language in meetings, contracts and documentation; travel to sites and suppliers part of the schedule; German is not a working language — stated plainly, on the list for year one.
Experience from hydrogen, renewable energy, the process industry or oil and gas	No hydrogen stations. Process industry under GMP/FDA/EMA, energy and water infrastructure and MV/HV electrical installations — the same documentation, deviation and acceptance discipline, in a different medium.
Project management certification such as PMP, IPMA or PRINCE2	No certification yet. Method documented in practice — baseline, forecast, risk register, change log, acceptance protocol — and I will certify on the company's preferred standard.

THE CUSTOMER DOES NOT BUY A STATION — THEY BUY THE DAY IT WORKS

A **heavy-duty** haulier plans around a ten-minute stop, and an operator plans around the availability of the whole network: the AFIR requirement of a **zero-emission** refuelling station every 200 kilometres only works if the stations that are built actually run. That is why the last week of a project matters more than the first, and why the acceptance protocol, the spare-parts list and the service handover are not administration — they are the product. Cavendish has spent twenty-two years and 150-plus stations building that reputation; my job would be to protect it one delivery at a time.

WHY THIS ROLE, AND WHY NOW

The last two years have narrowed the portfolio and the organisation, and shifted the weight from developing the next generation to delivering what has already been signed — which makes execution the company's whole priority, and it is the part of the job I am best at and want **ownership** of. I am not looking for a station to design. I am looking for the four documents that decide whether it is delivered, and the team and the customer that have to believe them.
