Application: Project Manager Construction Denmark

Dear Jesper,

A charging station is not decided on the plot. It is decided at the grid connection and at a municipal desk. The canopy, the chargers and the asphalt are repeatable; Fastned has put them up **414 times**. What is not repeatable is the 400 kW that has to come from somewhere, the easement nobody wrote down, and the case officer who has never assessed a charging hub before. In Denmark, that is where the date is set — and that is where a construction project manager earns the salary.

Fastned ended **Q1 2026 with 414 stations in nine countries**, had **65 stations under construction** in Q3 — almost twice the year before — and is heading for **476-506** by the end of 2026, with **1,000** in sight for 2030. In Denmark the network went from **three to seven** sites in a few months, four of them won in a Danish **tender** and built along the **E45** at Pedersminde, Blankhøj and Gudenå East and West, with **400 kW** chargers and up to twelve bays. At roughly **€892,000 per location**, including charging hardware, **grid connection**, **transformer** and canopy, every week of delay is real money on a specific site.

1. The grid connection is the project. The canopy can be planned from a template. The connection cannot: it depends on the local **grid**, the **transformer** that may or may not be there, and a **distribution** operator with its own queue. I have spent four years on the other side of the meter, responsible for HV and LV **switchgear**, transformers, **SRO/SCADA** and a 24/7 supply that could not fail — and I hold a Danish electrician authorisation for **LV/MV/HV**. I have not yet filed a **grid connection** application with a Danish DSO, and I will not pretend otherwise; it is the first process I would learn.

2. The standard station is the product. Deviations are the cost. When a location costs **€892,000** and the build is repeated dozens of times a year, the money is in the second and third visit — in the **material supply** that arrived early, the **contractor** who was briefed once, and the drawing that did not need a site-specific answer. **Standardisation** is what makes the third station cheaper than the first. On **37 capital projects** I standardised templates and check points and cut the same argument twice over; on **11 concurrent contracts** I moved capacity before a bottleneck became a delay.

3. A new country is built by its first ten partners. A **roadmap** for construction initiation is not a document about Denmark; it is a list of names — two **contractors**, one **engineering partner**, one **supplier** of switchgear, one **HSE** adviser, one **authority** contact — and a written understanding of the standards each of them works to, so the first **mobilisation** does not start from zero. I have built that list before, three times, in three different technical environments, and it always starts with a visit and a question, not a spreadsheet.

4. The schedule is a chain of permits and people, not a Gantt chart. A **permit** that waits three weeks for a signature, a landlord who changes the access road, a **safety compliance** step that has to be signed off before the crane arrives: each of them owns a date in the plan, and none of them answers to the plan. **Stakeholder** management is the job — with the municipality, the DSO, the landlord, the contractor and, occasionally, the neighbour who did not know a station was coming. A **scale-up** does that while the first country is still being built.

What I have not done. I have not built a charging station, worked in **e-mobility**, or handled a Danish **permit** for a charging hub; and I have never filed a DSO application. What I bring instead is construction delivery on **37 projects** with **schedules** and **budgets** that had to hold, **procurement** and **suppliers** in three companies, HV/LV installations, **commissioning** and **handover** that had to pass someone else's inspection, and a **driving licence** and a passport that are both used.

Practical. I live in **Måløv**, about 20 km from central Copenhagen, so a hybrid week in the city works. **Danish** native, **English** at business level. **Driving licence B**; **travel** within Denmark and abroad is not a problem. Available by agreement.

Kind regards

Shahram Ajloo

PROFILE

Construction and operations manager with twelve years of leadership in technical delivery: **37 capital projects** under external inspection, **11 concurrent contracts**, full **P&L** in my own company since 2023, and four years responsible for HV/LV **switchgear**, transformers and 24/7 supply. Danish **LV/MV/HV** authorisation, and happy to own the date.

GRID, POWER AND TECHNICAL INFRASTRUCTURE

- **HV and LV systems:** Four years responsible for switchgear, transformer stations, panels and SRO/SCADA; Danish LV/MV/HV authorisation (2023).
- **Commissioning:** Commissioning and handover of 37 installations: FAT/SAT, documentation and a sign-off that had to satisfy an authority, not just a customer.

CONSTRUCTION DELIVERY

- **Schedules and budgets:** 37 projects tracked with milestones, cost lines and change control in SAP; zero critical findings at handover.
- **Contractors on site:** Up to 14 people and 11 contracts with subcontractors and an own workshop: scope, access, sequence and a quality check before the next trade arrived.

PROCUREMENT, SUPPLIERS AND MATERIAL

- **Procurement:** Procurement, material supply and supplier selection in three companies; stock and delivery times treated as part of the plan.
- **Negotiation:** Negotiation with suppliers, subcontractors and customers: price, scope and a delivery date that is actually achievable.

SAFETY, PERMITS AND STAKEHOLDERS

- **HSE on site:** HSE as a condition of work: APV, LOTO, access control, and incidents reviewed rather than filed.
- **Authorities:** Documentation approved by authorities under GMP/FDA/EMA; permits and inspections treated as design inputs.

EXPERIENCE

Owner / Technical Director — ELOHVAC ApS · Copenhagen · May 2023–present

Scope: 5 electricians + 3 apprentices · full P&L · procurement, pricing, customer delivery

- **Running delivery as a business:** Prices, suppliers and deadlines that matched what was sold — and saying no to a date that could not be held.

Senior Commissioning Engineer / Project Manager — Novo Nordisk A/S · Kalundborg / Bagsværd · Nov 2022–Jul 2024

Scope: 37 capital projects · 25 specialists · schedules, budgets · SAP · authority documentation

- **Thirty-seven projects, one standard:** Commissioning, handover and change control in SAP; one checklist shared with engineering partners and trades, so every site was inspected the same way.

Project and Workshop Manager — Ventek Air ApS · Vedbæk · Jan 2022–Nov 2022

Scope: 14 staff · 11 concurrent contracts · suppliers, subcontractors, own workshop

- **Eleven sites at once:** Material supply, sequence and contractor coordination across eleven jobs — capacity moved before a bottleneck became a delay.

Head of Operations and Maintenance — Biofos (Lynetten) · Copenhagen · Aug 2017–Jan 2022

Scope: 24/7 plant · HV/LV switchgear, transformers, pumps, SRO/SCADA · HSE, standby, permits

- **Power that could not fail:** Switchgear, transformer stations and standby owned end to end; safety compliance and permits handled with authorities and contractors on site.

Production Foreman / Electromechanical Technician — ARJ Engineering · Tehran · 2003–2010 · 12 mechanics and technicians

- **First leadership role:** Shift planning, allocation and training in a workshop where drawings and deadlines arrived the same morning.

EDUCATION AND AUTHORISATION

Danish electrician authorisation, LV/MV/HV — authorised mechanical engineer (maskinmester) · Danish Safety Technology Authority · May 2023

B.Tech, Technology Management and Mechanical Engineering (EQF 6) · Copenhagen School of Marine Engineering & Technology Management · 2017–2022 · GPA 7.6/12

Electrical and Mechanical Design, Electrical Engineering (EQF 6) · Tehran Technical University · 2000–2003

Lean: 5S, PDCA, VSM, A3 · refrigeration and HVAC technology (AMU) · STCW safety · Mercantec 2021 · Danish Maritime Authority 2021–2023

LANGUAGES, PRACTICALITIES AND REFERENCES

Danish: native · **English:** business level, written and spoken · **Persian:** native · Based in **Måløv**, about 20 km from Copenhagen · **Driving licence B** · **Travel** within Denmark and abroad · Available by agreement · References on request.

THE FIRST 90 DAYS — FROM SITE TO ENERGISATION

Period	What happens, and how it is measured
Week 1–2	Read the pipeline: every site in Denmark with its grid connection status, permit status and date. Visit three sites — one in build, one waiting for power, one in operation — with the contractor who built it. Ask what cost them a month.
Day 30	A one-page map of the Danish process: DSO, municipality, landlord, contractor, authority, and where each of them can stop the date. Reviewed with the Construction Lead and the country team before it is used.
Day 60	The roadmap for construction initiation drafted from that map: local partners, standards, safety compliance at each stage, and the documents a new site needs. One standard station sequence agreed with the engineering partners.
Day 90	Two sites moved measurably closer to energisation, with the date and the reason written down; a partner list with names, not categories; and a risk log that the country manager can read in five minutes.

A GRID CONNECTION IS A QUEUE, AND QUEUES ARE MANAGED

The connection is not a form; it is a position in someone else's plan. The way to move it is to know the DSO's process better than the DSO expects, to bring a complete application the first time, and to keep a written record of every answer. I have spent four years on the receiving end of that conversation, which is a good place to have learned it from.

THE SECOND STATION SHOULD COST LESS THAN THE FIRST

In a **roll-out**, the unit is not the project; it is the repeat. The first station is learning, the second is a test of whether the learning was written down, and the tenth is the business case. Standard **material supply**, one sequence, one checklist and one person who owns the lessons is how a build-out stays cheap while it gets fast.

SAFETY IS A SEQUENCE, NOT A POSTER

On a charging site the dangerous moment is rarely the finished station; it is the temporary one — excavation near a cable, a crane over a live connection, a subcontractor who arrives a day early. **Safety compliance** therefore belongs in the sequence, with a named person and a signature before each stage, and an incident review that changes the next site rather than the paperwork.

A NEW COUNTRY IS A LIST OF NAMES

Fastned's advantage is a station design that can be repeated and a team that has done it before. What Denmark adds is local: a DSO, a municipality, a landlord, a contractor, a **supplier** of **switchgear**, and a set of standards that are similar to the ones in the Netherlands but not identical. The first year is spent turning that list into partners — and turning the partners into a process someone else can run.

WHERE I WOULD START

At the connection. First week: the pipeline by connection status, three site visits, and the DSO's process read line by line. Then a map of where the date actually gets lost — application, permit, material or contractor — because those four problems look the same in a spreadsheet and are solved by completely different people.

WHAT THE POSTING ASKS FOR — WHAT I HAVE	
Requirement in the posting	Evidence
Acquisition and realization of grid connections	Four years responsible for HV/LV switchgear, transformer stations and 24/7 supply; Danish LV/MV/HV authorisation. No DSO application filed yet — the first process I would learn.
Collaboration with engineering partners	37 capital projects with 25 specialists and external designers; drawings, calculations and standards agreed before the trades arrived.
Material supply and planning for the construction	Long-lead items ordered first, supplier delivery times in the plan, stock and spares owned in two companies.
Monitor the schedules and budgets	37 projects tracked with milestones, cost lines and change control in SAP; full P&L in my own company since 2023.
Coordinate internal and external stakeholders from Denmark and abroad	Technique, procurement, operations, authorities and suppliers kept aligned on 37 projects, with international suppliers and Danish regulators in the same room.
Visit partners and sites — negotiation and a hands-on mentality	Site presence as the default: contractor briefings, inspections and supplier meetings on location, not on video.
Create a roadmap for construction initiation in a new country	Built partner lists and processes in three companies and three technical environments; the 90-day map on page 3 is how I would do it here.
Identify new local partners and analyse standards	Contractors, suppliers and advisers selected and qualified in 37 projects and 11 contracts; standards read as design inputs.
Ensure safety compliance at different stages	HSE with APV risk assessments, LOTO, access control and incidents reviewed; safety compliance as a sequence with named owners.
Support site evaluations and due diligence	Technical and commercial assessment of sites and installations: load, connection, condition, cost — the questions that decide whether a site works.
Degree in engineering, business or equivalent	B.Tech in mechanical engineering and technology management (EQF 6), electrical and mechanical design (EQF 6) and a Danish LV/MV/HV authorisation.
Strong technical affinity	Comfortable in a substation, on a roof and in a spreadsheet; commissioning, handover and fault-finding as daily work.
4+ years of experience in deployment and/or construction	Twelve years in technical delivery, including 37 capital projects, 11 concurrent contracts and four years of 24/7 operations.
Work structured and prioritize tasks efficiently	Standard templates, check points and a written plan per project; priorities decided on the date and the cost, not on who called last.
Strong negotiation and communication skills	Prices, scope and dates negotiated with suppliers, contractors and customers in my own company; bad news delivered early and in writing.
Excellent organizational skills and a high level of initiative	Templates, procurement routines and safety practices introduced because nobody else had done it — in three companies.
Navigate and manage stakeholder dynamics	Municipal, authority and landlord constraints, and competing internal priorities, handled with an agenda, a decision and a record.
Willingness to travel abroad and within Denmark	Driving licence B; worked across Zealand and Jutland with suppliers and authorities; passport in order.
Near-native Danish and business English	Danish native, English at business level, Persian native; documentation and meetings in all three as required.
Driving licence	Driving licence B; car in daily use between Måløv, Copenhagen and sites.
Genuine interest in the energy transition	More than twenty years in technical delivery, including five years of energy management in Copenhagen with over 40 % lower consumption documented.
Team player who thinks on their own feet and takes ownership	Owner of a company and of 37 project deliveries: decisions taken, mistakes owned and the lesson written into the next project.
