6 November 2026

VELUX · Bækgårdsvej 39, Skjern · Technical Services Manager

**Application: Technical Services Manager, VELUX Skjern**

To the General Manager and the hiring team at VELUX Skjern

A highly automated line does not fail slowly. It stops — and in the minute it stops, every decision that was not made in the year before shows up at once: the bearing nobody planned to change, the spare part that was not on the shelf, the alarm that had been dismissed four times, the technician who was the only one who knew the machine. Technical Services exists to make sure that minute does not happen. That is the job in Skjern, and it is the job I have done on a plant that could not stop.

**I would lead Technical Services on four fixed things.** First, **availability is designed, not repaired**: a maintenance strategy per asset built from criticality and failure mode — what stops the line, what is cheap to prevent, what is cheaper to run to failure — with uptime, MTBF, MTTR and response time measured and reviewed monthly, not discovered in a shutdown. Second, **a blueprint has to be portable**: if Skjern is to be the model for the site in France, the model has to be written down as standards rather than lived as habits — asset register, maintenance concept, spare-parts policy, data model, roles and decision rights, aligned with VELUX global standards — so another site can adopt it without Skjern standing next to them. Third, **digitalisation only where it removes a decision or a manual step**: condition data, alarm logs and production data turned into something a technician and a manager can act on — the operational KPIs the site is measured on — with the before-and-after number attached. Fourth, **engineers and technicians grow through the work**: a competence matrix and capability plan per area, project engineers with a real mandate, and coaching that makes the team less dependent on any single person — including me.

Equipment reliability is my daily trade. For five years I was operations and maintenance manager at **Lynetten under Biofos**, one of Denmark's largest wastewater plants, in **24/7 operation**: pumps, blowers, ventilation, transformers, switchgear, drives and SCADA, with a maintenance team, a spare-parts stock and an availability target that was not negotiable. I ran **condition-based maintenance**, **criticality assessment** per system, **root cause analysis** on repeat failures and **5S and PDCA** on workshop and stores — equipment stability and process optimisation as a daily discipline rather than a project — and energy management on metering and SCADA data delivered **more than 40 % lower consumption**, documented and sustained.

Building and integrating new equipment is the other half of this role, and I have done it inside a regulated production environment. At **Novo Nordisk** I ran **37 parallel capital projects** with **25 highly specialised engineers and specialists**, 2–10 million DKK each, through **FAT/SAT, IQ/OQ/PQ, installation and commissioning** into live production, with **zero critical findings** at audited handover. That is where you learn the difference between a machine that works and a machine that is reliable: acceptance criteria that can be tested, documentation that follows the asset, and a handover that ends without reservations.

I have led the teams this role leads. As owner of **ELOHVAC** since 2023 I run **five electricians and three apprentices** with full P&L and a **driver's licence and a car in daily use** for a service business; before that I led **14 employees and 11 concurrent projects** at **Ventek-Air**, with daily boards, capacity planning and standardised work, and **12 technicians** at **ARJ Engineering** in a machine workshop where root cause and follow-up were the daily measure. Digitalisation is not a slide for me: I build my own tools in **Python and Claude** — KPI dashboards, automated reporting, checklists and calculation — with **over 40 % documented productivity gain**, and I use them to remove manual work rather than to add another system to learn.

VELUX is a family-owned company with foundations behind it, a mature Lean culture and a production site in Skjern that is being asked to become the reference for another country. That combination is what attracts me: technical work that has to be good enough to copy, in a company where courage and mutual respect are stated values rather than posters. Values-based leadership, collaboration and technical excellence are the three things I would bring as Technical Manager, together with the stakeholders across Operations, Engineering, Quality and Production that this role sits between. I would like the technical standard in Skjern to be something a colleague in France can pick up and use — and I would like the people who built it to be the ones who teach it.

Practically: I live in Måløv, Skjern is around three hours away by car, and I plan my weeks around being at the site and at home at weekends. I speak and write fluent **Danish and English**, hold a **B.Tech degree in Technology Management & Mechanical Engineering** (marine engineering direction) and an electrical authorisation **LV/MV/HV**, and I can start by agreement. I would like to hear where Skjern's biggest availability losses are today, and which part of the Skjern model is meant to travel to France first — that is where I would begin.

Kind regards,

Shahram Ajloo

## PROFILE

Technical services and maintenance leader with 20+ years in 24/7 critical plant, capital projects and regulated manufacturing — authorised machine and electrical installer (LV/MV/HV) with a B.Tech in Technology Management & Mechanical Engineering, the marine engineering direction VELUX asks for. Five years owning availability, condition-based maintenance, criticality and spare parts on a plant that could not stop, with over 40 % lower energy consumption documented. Delivered 37 capital projects with 25 specialists through FAT/SAT, installation and commissioning with zero critical findings. Leads engineering and technician teams of 5 to 25 and builds the tools that make KPI and condition data usable — over 40 % productivity gain.

## RELIABILITY, MAINTENANCE AND TECHNICAL DEVELOPMENT

- **Equipment availability and reliability:** Uptime, breakdowns and response times measured monthly on a 24/7 plant; repeat failures taken to root cause and the maintenance plan built from criticality instead of from the calendar.
- **Maintenance strategy, criticality and spare parts:** Condition-based and preventive maintenance per asset group: failure modes identified, criticality ranked by consequence for production, intervals set from data, and run-to-failure chosen deliberately where it is cheaper; spare-parts stock, alternatives and lead times built on the same criticality.
- **Technical projects and new equipment:** 37 capital projects from specification to handover: acceptance criteria, FAT/SAT, IQ/OQ/PQ, installation and commissioning into live production, with documentation that follows the asset and zero critical findings at audit.
- **Digitalisation and data:** SCADA, metering and CMMS data turned into KPI boards and automated reporting in Excel, Python and Claude; condition and alarm data used to predict and prioritise rather than to describe the past — over 40 % productivity gain in my own operation.
- **Lean and continuous improvement:** 5S, standard work, PDCA, A3 and value stream mapping as daily practice; improvement ideas from technicians taken to standard with an owner, a date and a number that must move.

## TOOLS AND METHODS

| Task | Tool and documented use |
|---|---|
| **Maintenance management** | CMMS for work orders and history, criticality register, PM and condition-based plans, spare-parts lists; MTBF, MTTR and uptime as the monthly measures. |
| **Reliability engineering** | Root cause analysis (5-why, Ishikawa, A3), failure mode thinking, condition monitoring and alarm review; corrective actions closed with verification of effect. |
| **Project and commissioning** | Stage gates, acceptance criteria, FAT/SAT, IQ/OQ/PQ, as-built documentation and handover packages; contractor follow-up to deadline. |
| **Digitalisation** | Python and Claude for dashboards, automated reporting, calculation and checklists; SAP and Excel for orders, cost and asset data in daily use. |
| **Lean and operational excellence** | 5S and visual management, standard work, PDCA, value stream mapping and Kaizen; daily boards and bottleneck analysis in a 24/7 operation. |
| **Leadership** | Daily boards, one-to-one and appraisal conversations, competence matrix and training plans, technician and apprentice development — decisions taken where the knowledge is. |

## EXPERIENCE

**Owner / Technical Director** — ELOHVAC ApS · Copenhagen · May 2023–present

**Scope:** 5 electricians and 3 apprentices · full P&L · electrical installation, control and service

- **Technical service with a P&L:** Technical service to business customers with full P&L: fault finding, preventive maintenance, control and panels; documentation and KPI reporting automated with Python and Claude, over 40 % productivity gain.

**Senior Commissioning Engineer / Project Manager, Electrical Systems** — Novo Nordisk A/S · Kalundborg/Bagsværd · Nov 2022–Jul 2024

**Scope:** 37 parallel capital projects · 25 specialists · 2–10 million DKK each · GMP/FDA/EMA

- **New equipment into live production:** FAT/SAT, IQ/OQ/PQ, installation and commissioning of technical systems into operating production; acceptance criteria defined and tested and documentation handed over complete, with zero critical findings at audit; schedules, cost and risk reported monthly to management and client.

**Project and Workshop Manager** — Ventek-Air · Copenhagen · Jan 2022–Nov 2022

**Scope:** 14 employees · 11 concurrent jobs · 2–10 million DKK per job

- **Capacity, priorities and standard work:** Daily boards, capacity and bottleneck analysis across eleven concurrent jobs; standardised working methods with a marked lift in delivery performance.

**Operations and Maintenance Manager** — Lynetten under Biofos · Copenhagen · Aug 2017–Jan 2022

**Scope:** Critical process plant in 24/7 operation · pumps, blowers, ventilation, transformers, switchgear, drives and SCADA

- **Availability, maintenance and energy:** Availability, breakdown and response time on the monthly board; condition-based maintenance and criticality across systems; spare-parts flow and 5S on stores; energy management on SCADA data with over 40 % lower consumption.

**Electromechanical Technician / Production Supervisor** — ARJ Engineering · Tehran · Dec 2003–Mar 2010

**Scope:** 12 mechanics and technicians · machine workshop · industrial equipment

- **Machine reliability and people:** Fault diagnosis and repair of industrial electrical and mechanical equipment; root cause analysis and corrective action; shift planning, training and follow-up on output and quality targets for 12 technicians.

## EDUCATION AND AUTHORISATION

**B.Tech, Technology Management & Mechanical Engineering** · Maskinmesterskolen København · 2017–2022 · GPA 7.6/12 · marine engineering direction

**Authorised machine and electrical installer (LV/MV/HV)** · Danish Safety Technology Authority · May 2023

**Electrical and mechanical engineering** · Tehran Technical University · 2000–2003 · EQF 6

**Refrigeration, ventilation and safety training · STCW** · Mercantec 2021 · Danish Maritime Authority 2021

## LANGUAGES, PRACTICAL AND REFERENCES

Danish: native · English: fluent, written and spoken · Persian: native · Driver's licence B and car · Based in Måløv, Skjern around three hours away, weeks planned around the site · Available by agreement · SAP, Excel and Python daily · References on request.

## WHAT THE ROLE ASKS FOR — MY EVIDENCE

| Requirement | Evidence |
|---|---|
| **Proven leadership of technical, engineering, maintenance or project teams** | Five years leading operations and maintenance in a 24/7 critical plant; 14 employees and 11 concurrent projects at Ventek-Air; 12 technicians at ARJ; 25 engineers and specialists across 37 capital projects at Novo Nordisk, an international GMP/FDA/EMA organisation. |
| **Technical qualification — engineering, production technology, marine engineering or similar** | B.Tech in Technology Management & Mechanical Engineering, the marine engineering direction, EQF 6; electrical authorisation LV/MV/HV; hands-on background as electrician and electromechanical technician. |
| **Lean principles, operational excellence and continuous improvement** | 5S, standard work, PDCA, A3, value stream mapping and Kaizen applied daily in 24/7 operation and in project delivery; improvements taken to standard with an owner, a date and a measure. |
| **Experience driving technical development, automation, digitalisation or production improvement** | Condition-based maintenance and SCADA-based optimisation with over 40 % lower energy consumption; digitalisation of documentation, KPI and reporting flows with Python and Claude, over 40 % gain. |
| **High equipment availability, reliability and performance** | Availability, breakdowns and response times measured monthly on a plant that could not stop; criticality assessment, spare-parts strategy and root cause on repeat failures. |
| **Installing, integrating and optimising new machinery and technology** | FAT/SAT, IQ/OQ/PQ, installation and commissioning of technical systems into live production across 37 projects, with handover documentation complete and zero critical findings. |
| **Communicating across levels, building trust, fluent Danish and English** | Monthly reporting to management and client; daily cooperation with operations, quality, suppliers and contractors; Danish native and fluent English in written and spoken reporting to management, auditors and international suppliers. |

## FIRST 90 DAYS — AVAILABILITY, STANDARDS AND THE BLUEPRINT

| Period | What happens, and how it is measured |
|---|---|
| **Week 1–2** | Walk the line with the maintenance technicians and the project engineers: where it stops, why it stopped last month, and what the shift does when it does. Read the maintenance plan, the breakdown history, the spare-parts list and the open technical projects. Meet production, quality and the international colleagues in the forums the role sits in. |
| **Day 30** | A one-page reliability picture: uptime and losses by asset group, the five failures that cost the most production, the state of the maintenance plan against criticality, and the three technical projects where a decision is missing. |
| **Day 60** | Maintenance strategy agreed per critical asset group with the team and production; spare-parts policy reviewed on criticality and lead time; competence matrix in place with the training gaps that matter; first digitalisation step chosen where the manual work is heaviest. |
| **Day 90** | A monthly reliability and KPI rhythm that the team owns — uptime, MTBF, MTTR, response time, maintenance backlog; the first improvement measured before and after; and the first draft of the Skjern standard that is meant to travel to France, written so a colleague who was not in the room can use it. |

## A BLUEPRINT IS ONLY WORTH SOMETHING IF IT WORKS IN ANOTHER COUNTRY

Being the reference site is a different assignment from being a good site: a good site runs on the knowledge of its people, a reference site on standards its people can hand over. So every improvement in Skjern gets written the moment it works — installation and integration included: what the asset is, what the failure modes are, which maintenance intervals were chosen and why, which spare parts are held, which data is collected and who decides. That document is what a site in France actually receives — the machines they will buy anyway, but the thinking they cannot buy.

## AVAILABILITY IS A DECISION MADE MONTHS BEFORE THE STOP

Nobody decides to have a breakdown. It is decided earlier, quietly, when a maintenance interval is left on the calendar because nobody questioned it, when a critical spare is not held because it has not been needed yet, or when an alarm is acknowledged and forgotten. So the work is to move those decisions to where they can be seen: a criticality list per asset group, a maintenance plan that reflects failure modes rather than a supplier's default, and a monthly review where the same three questions get asked of every repeat failure until the answer changes.

## DIGITALISATION THAT ENDS AS A DASHBOARD NOBODY OPENS IS A COST

Condition monitoring, SCADA and CMMS already produce more data than a technical organisation can read, and analytics only helps if it ends in a decision. The value is not in collecting more; it is in turning what exists into a decision someone makes on a Tuesday: this bearing is trending, this line loses two hours a week to one alarm, this spare part has a lead time that makes the stock level wrong. I build those views myself in Python and Claude, which is why digitalisation in my teams has a before-and-after number attached instead of a project plan.

## THE TEAM'S COMPETENCE IS THE REAL SPARE PART

Every technical organisation has a machine that only one person can fix, and every one of those is a risk with a salary. The answer is not to document faster after they leave; it is a competence matrix that shows, area by area, who is signed off, who is in training and where the single points of failure are — and then a training plan built from the production plan rather than from enthusiasm. Project engineers and engineering specialists grow the same way: give them a real mandate on a real project, sit next to them at the difficult meeting, and let them own the result.

## SAFETY AND RELIABILITY ARE THE SAME CONVERSATION

In a highly automated plant the dangerous moments are the interventions: the guard that has to be opened, the line that has to be jogged, the maintenance that has to happen while production is waiting. LOTO, permits, risk assessment and near-miss reporting are not paperwork around the work — they are the conditions that make it possible at the speed it has to happen. I have run that discipline in a 24/7 plant and on construction sites, and I have never seen a team object to it when the standard was explained and applied consistently.

## VELUX IS A COMPANY THAT MEASURES ITSELF IN DECADES

A family-owned company with foundations behind it, 20 production companies in 12 countries and a product built around daylight and fresh air, is not optimising for the next quarter. That suits how I work: build the asset register properly, make the maintenance plan honest, train the people who will still be there in ten years, and let the numbers improve because the foundation is right. Courage and mutual respect are useful values in a technical organisation — the courage to say the machine is not ready, and respect for the technician who says it first.
