4 November 2026

Resident Engineer · Hyperscale data centre campus · Fredericia, Denmark

Application: Resident Engineer

Dear Project Manager,

A punch list is not a list of defects. It is a list of decisions that were postponed. Every item on it was once a question that could have been answered in a week: an RFI nobody closed, a hold point nobody witnessed, a clearance nobody measured. By the time it reaches the list, it is a trade standing still, a test that cannot start, and a **handover** date somebody has to move. On a **hyperscale** campus that postponement happens in a thousand places at once — which is why the **resident engineer**'s real job is not to find defects at the end, but to force the decision while it is still cheap.

5 levels. Commissioning runs from Level 1 to Level 5, and every level asks a different question: does it pass the **factory acceptance test**, does it start on site, does it function, does the whole system stay up when one part fails, and does the building still perform in operation. My part is the same at each level — read the script before the witness, check the evidence against the acceptance criterion, and do not sign until the number in front of you is the number in the test. I have written **factory acceptance** and **site acceptance** protocols before the test was run on 37 projects, with **zero critical findings** at handover.

0 open non-conformances. A **non-conformance** closed because the contractor pushed is not closed; it is rescheduled. So every **ITP** on my sites has named hold points, every hold point has a witness, and every **NCR** is closed on root cause with a date and a name attached. The **punch-list** gets the same treatment: an item is closed when someone has seen it working, not when someone has promised it will be.

1 drawing at a time. RFIs, **submittals**, **material approvals**, **shop drawings** and **coordination models** are reviewed against the specification and against the space that actually exists: can it be installed, can it be maintained, and does it collide with the next trade. An answer that arrives after the installation window is not an answer; it is a **design change** with a price. I keep the response inside the **programme**, and I say no in writing rather than late.

14 trades. Supervision on a campus is not standing behind one crew. It is a daily **walkdown** of the areas where the sequence is about to break: **power distribution**, **generators**, **UPS**, **switchgear**, **chillers** and **cooling systems**, **building management** controls and everything that has to be finished before the next trade can start. I ran 11 concurrent contracts with 14 people; the method is the same at any scale — one owner, one date, and a written record of what was agreed on the floor.

37 projects on programme. Progress is tracked against the **programme**, not against the impression of the site: what was planned this week, what was installed, and what that does to the next three. Risks are **flagged early** — the delivery that will not arrive, the access that will not be granted, the witness who cannot come — and reported with a date and an owner, not as a concern. Budget and **forecast** in SAP on 37 projects; full P&L in my own company since 2023.

24 hours. The report goes out the day it happened. Daily progress, weekly look-ahead, and any risk that changes the date in the same 24 hours it is found. Bad news delivered with a plan costs a conversation; bad news delivered late costs a fortnight.

The MEP side is my own trade. Authorised marine and mechanical engineer at LV/MV/HV level, electrical and mechanical design (EQF 6), B.Tech in technology management — plus ventilation, HVAC and refrigeration delivered as contracts, and four years responsible for a plant in 24/7 operation with pumps, HV switchgear and SCADA. **Generators**, **UPS**, **switchgear**, **chillers** and controls are systems I have installed, tested and handed over, not systems I have only read about.

Practicalities. Based in Måløv; Fredericia is about two hours by car and I will be resident on site through the working week for as long as the build needs it. Driving licence B. Danish native and professional English — on a Danish campus run in English with Danish subcontractors, both matter. Available at short notice.

Kind regards

Shahram Ajloo

SHAHRAM AJLOO

Resident Engineer · MEP, QA/QC and commissioning on site

+45 93 99 95 14 · ajlooshahram@gmail.com · linkedin.com/in/shahramajloo · Copenhagen area

PROFILE

Site-based engineer with twenty years in **MEP** and **critical infrastructure**: authorised marine and mechanical engineer at LV/MV/HV level, electrical and mechanical design (EQF 6), B.Tech in technology management. 37 CAPEX projects with **FAT/SAT**, IQ/OQ/PQ and **zero critical findings** at handover; 11 contracts with a team of 14; four years of 24/7 plant operation; full P&L since 2023.

SITE SUPERVISION AND QUALITY

- **Inspections and walkdowns:** Daily walkdowns against drawings, specifications and approved methods; issues recorded the day they are seen, with an owner and a date.
- **QA/QC and ITPs:** Inspection and test plans with named hold points and witnesses; QA/QC enforced on the floor, not audited after the fact.
- **Non-conformances and punch-list:** NCRs closed on root cause, punch-list items closed only when seen working; the close-out file that stands up when the client asks.

TECHNICAL MANAGEMENT

- **RFIs and submittals:** RFIs, submittals, material approvals and technical queries answered inside the programme; answers in writing so nobody re-argues them later.
- **Shop drawings and models:** Shop drawings and coordination models reviewed for constructability, clearances and compliance with the specification before the trade mobilises.
- **Design changes and interfaces:** Design changes and site instructions priced and recorded; design, construction and commissioning held to the same interface list.

COMMISSIONING AND HANDOVER

- **Levels and witnesses:** Commissioning witnessed level by level, from factory acceptance through site acceptance to integrated systems testing; no signature without the criterion met.
- **Test records and O&M:** O&M manuals, test results and commissioning documentation reviewed for completeness and accuracy — not accepted because they arrived.
- **Handover packages:** Handover packages complete: as-builts, test records, punch list closed, training done, warranty clear — zero critical findings at acceptance.

EXPERIENCE

Owner / Technical Director — ELOHVAC ApS · Copenhagen · May 2023–present

Scope: 5 electricians + 3 apprentices · full P&L · installation, testing and handover

- **Site delivery and commercial risk:** Projects from quotation to handover with own budget and own risk; subcontractors, material control and QA — and the decision to decline work that cannot be delivered.

Senior Commissioning Engineer / Project Manager — Novo Nordisk A/S · Kalundborg / Bagsværd · Nov 2022–Jul 2024

Scope: Electrical systems · 37 concurrent CAPEX projects · 25 specialists · GMP/FDA/EMA

- **Witnessing and acceptance:** FAT/SAT and IQ/OQ/PQ with protocols written before the test; milestones and reporting in SAP ERP — zero critical findings at handover.

Project and Workshop Manager — Ventek-Air · Copenhagen · Jan 2022–Nov 2022

Scope: 14 employees · 11 concurrent contracts · DKK 2–10 m each · ventilation and cooling

- **Parallel delivery under pressure:** Crews and suppliers moved between contracts when one ran behind; the customer informed the same day, with a plan rather than an apology.

Maintenance and Operations Manager — Biofos (Lynetten) · Copenhagen · Aug 2017–Jan 2022

Scope: Treatment plant in 24/7 operation · pumps, HVAC, HV switchgear, SCADA

- **Live plant, planned outages:** Preventive maintenance and fault-finding around the clock; outages planned into narrow windows with the fallback designed before it was needed. LOTO and APV.

Electromechanical Technician / Production Team Leader — ARJ Engineering · Tehran · Dec 2003–Mar 2010 · 12 mechanics and technicians

EDUCATION AND AUTHORISATION

Authorised Marine and Mechanical Engineer — Danish electrical authorisation LV/MV/HV · Danish Safety Technology Authority · May 2023

B.Tech, Technology Management and Mechanical Engineering (EQF 6) · Copenhagen School of Marine Engineering & Technology Management · 2017–2022 · GPA 7.6/12

Electrical and Mechanical Design, Electrical Engineering (EQF 6) · Tehran Technical University · 2000–2003

Refrigeration and HVAC (AMU) · Lean: 5S, PDCA, VSM, A3 · Mercantec · 2021 · STCW safety certificates (2021–2023)

English: professional, written and spoken · **Danish:** native · **Persian:** native · **Based in Måløv**, Fredericia about two hours by car — resident on site through the working week · **Driving licence B** · **Available at short notice** · References on request.

FIRST 90 DAYS — FROM THE FIRST WALK TO A HANDOVER PACK THAT STANDS UP

Period	What happens, and how it is measured
Week 1–2	Read the specification, the approved methods and the live ITPs for my areas; walk every area with the general contractor and the subcontractors, and open a risk list with an owner per line.
Day 30	Every area has a current status against the programme; open RFIs and submittals reviewed for age, not just for content, and the oldest ones closed first.
Day 60	Hold points and witnesses agreed for the next commissioning window; punch-list from the first systems closed to zero, with the evidence in the file.
Day 90	First system handed over complete: test records, O&M manuals, as-builts and training signed off — and a reporting rhythm the Project Manager can use without asking.

THE WITNESS IS THE POINT

A hold point that gets signed without a witness is worse than a hold point that is late, because it hides a question instead of asking it. So I arrive at the test knowing the criterion, I check the instrument calibration before I check the reading, and I write the result down while the system is still running. If the number is wrong, the answer is no — and the conversation about what it costs happens before the next pour, not after it.

AN RFI ANSWERED LATE IS A CHANGE ORDER

Every question on site has a date after which answering it costs money. That date is not in the RFI system; it is in the installation sequence. So the register is reviewed by age and by what it blocks, not by who shouted loudest, and the ones that stop a trade this week get answered this week. A resident engineer who only responds is a mailbox with a hard hat.

A CLOSED ITEM FOR THE WRONG REASON COMES BACK

Punch items get closed for three reasons: it is fixed, someone promised it will be fixed, or everyone is tired. Only the first one survives commissioning. I close on evidence — a photograph, a test, a measurement, a signature — because the item that comes back during integrated testing comes back at the worst possible moment, in front of the client, with the programme already tight.

A PERMIT TO WORK IS A SCHEDULE, NOT PAPER

On a campus, construction and energisation overlap for months, and that overlap is where the serious accidents live. Switching, isolation and LOTO are therefore planned with the same rigour as the installation: who holds the key, who signs the permit, which live boards are out of bounds, and what happens if the temporary supply is needed at 03.00. As an electrician and an authorised engineer at LV/MV/HV level I have worked on both sides of that permit — the one that issues it and the one that has to trust it.

MEP IS WHERE THE PROGRAMME IS ACTUALLY WON

On a data hall the structure can be ahead and the project still late, because power, cooling and controls have to be commissioned in an order that does not forgive a missing cable or an unlabelled valve. That is why the MEP sequence is planned backwards from the commissioning dates, and why the trades are walked every day rather than audited every month.

WHAT THE ROLE REQUIRES — WHAT I HAVE DELIVERED

Requirement in the posting	Evidence
Be the client's technical representative on site, reporting to the Project Manager	Client-side and contractor-side on the same projects: one voice for the customer on site, with decisions recorded and bad news delivered with a plan.
Oversee MEP installation: power distribution, generators, UPS, switchgear, chillers, cooling systems and building management controls	Power distribution, switchgear, UPS and emergency power installed and tested; chillers, cooling systems and HVAC delivered as contracts; BMS and SCADA in daily use.
Carry out regular site inspections and walkdowns	Daily walkdowns on 11 concurrent contracts; findings recorded the day they were seen, with an owner and a date.
Review work against drawings, specifications and approved methods	Drawings and specifications read against the floor as built; as-builts marked up and issued, not kept in a notebook.
Review and enforce QA/QC procedures	QA/QC enforced on site through ITPs and hold points; GMP/FDA documentation and KS on regulated sites.
Witness inspection and test plans (ITPs)	ITP hold points witnessed with the criterion in hand; calibration checked before the reading was accepted.
Close out non-conformances and punch-list items	NCRs closed on root cause; punch-list closed on evidence — zero critical findings at handover on 37 projects.
Review and respond to RFIs, submittals, material approvals and technical queries in line with the programme	RFIs and submittals answered against the installation sequence; material approvals checked for compliance before the delivery, not after.
Manage design changes and site instructions	Design changes priced, recorded and dated; variations approved in the week they arose, with full P&L responsibility in my own company.
Coordinate between design, construction and commissioning teams	Design team, construction and commissioning held to one interface list — 25 specialists across engineering, procurement and site.
Review contractor shop drawings and coordination models for constructability and compliance	Shop drawings and coordination models reviewed for constructability, clearances and maintenance access before the trade mobilised.
Support Levels 1-5 commissioning, witnessing factory and site acceptance tests and integrated systems testing	FAT/SAT witnessed and written before the test; functional and integrated systems testing on critical power and cooling, with IQ/OQ/PQ documentation.
Review commissioning documentation, test results and O&M manuals	O&M manuals and test records reviewed line by line; incomplete packages returned rather than accepted.
Ensure complete, accurate handover packages	Handover packages with as-builts, test records, punch list closed and training done — the file the operator actually uses on day one.
Track installation progress against the programme and flag risks early	Progress tracked weekly against the programme with a look-ahead; risks flagged with a date and an owner in the same 24 hours they appeared.
Work daily with the general contractor, specialist subcontractors, design teams and the commissioning team	General contractor and subcontractors steered from the floor; 14-person contract team and 11 contracts run in parallel.
Work hands-on at the centre of the build, from early works through to handover	On site, not in a site office: installation, testing and handover done with the crews, in my own company since 2023.
Deliver a hyperscale data centre campus on site in Fredericia, Denmark	Critical infrastructure rather than hyperscale by name: 24/7 plant, GMP-regulated build and mission-critical power and cooling — the same consequence of downtime, at a different scale. Danish native, professional English.

WHERE I WOULD START

With the areas closest to energisation. First week: the specification and approved methods for those areas, the open RFI and NCR registers sorted by age, and a walk with the contractor's site manager to see which of the two lists is telling the truth. Then the risk list, written the way I would want to receive it — one line, one owner, one date.
