5 November 2026

NNE A/S · Kalundborg · Department Manager, Electrical & Instrumentation (req5128)

Application: Department Manager — Electrical & Instrumentation

Dear Jannick Kartman

Electrical and instrumentation is where the process becomes controllable. A cable schedule, an instrument index, a loop drawing and a control philosophy decide whether a batch can be released — and in an API plant that is not a documentation detail, it is the product. An E&I department exists to make that true project after project, with people who are technically excellent and who stay. That is the department I want to lead at NNE.

I would run the department on four fixed things. First, one capacity board: every engineer and every consultant visible against the projects they serve, with a named owner per discipline scope and a weekly look at what is committed, what is coming, and where the next bottleneck is. Second, technical excellence you can audit: discipline standards for instrument index, loop and cable documentation, ATEX and panel design, plus design reviews at fixed milestones and FAT/SAT and IQ/OQ/PQ checklists that the project can reuse instead of writing from scratch. Third, competency development that is planned rather than accidental — a matrix per engineer across instrument types, control systems, electrical design and qualification work, with the senior specialists mentoring and the next hire decided before the gap appears. Fourth, one team across Denmark and Bangalore: overlapping hours, one source of truth, written handovers, and scope agreed before work travels.

I have led this discipline inside your customer's organisation. From 2022 to 2024 I was senior commissioning engineer and project manager for electrical systems at Novo Nordisk, with 37 parallel capital projects, 25 specialists and DKK 2–10m per project in Kalundborg and Bagsværd: acceptance criteria, FAT and SAT, IQ/OQ/PQ, deviation handling and audited handover with zero critical findings — under GMP, FDA and EMA. I have sat in the design reviews, walked the panels, signed the loop checks and defended the documentation in front of an inspector. That is exactly the work an E&I department at NNE delivers to Novo Nordisk every day, and I know both sides of the table.

My leadership comes from twenty years of building teams that deliver. I am the owner and technical director of ELOHVAC with five electricians and three apprentices and full P&L — recruitment, 1:1s, competence matrix, apprentices and customers in the same week. Before that I led 14 employees and 11 parallel construction projects at Ventek-Air, and 12 mechanics and technicians at ARJ. I have managed resource allocation across projects where two sites both needed the same specialist on the same Tuesday, and I have learned that the answer is a plan made in advance, not a phone call made in panic.

The electrical discipline is my profession, not an adjacent interest. I hold a B.Tech in Technology Management and Mechanical Engineering with electrical engineering studies from Tehran Technical University, and I am an authorised marine engineer with Danish electrical authorisation at LV, MV and HV — so I can challenge a protection philosophy, read the single-line diagram and the P&ID, and hold a technical conversation with the instrument engineer and the electrician in the same hour. Danish is my native language, English is my professional one; I have worked in English-speaking project organisations for years and I am used to the Indian collaboration model from the Novo Nordisk projects.

On dividing the week between projects and the department. The trap in a role like this is becoming the best project engineer in the department at the expense of the department. My rule is simple: the calendar is the resource plan. Two fixed days for department work — capacity, competence, reviews and the conversations that cannot be moved — and project time blocked and visible, so nobody has to guess where I am. And every technical decision I make in a project becomes a standard or a template afterwards, so the next project does not need me in the same place.

NNE's values describe the manager this role needs: **take initiative and get things done** — a department that answers in hours, not weeks; **be passionate about pharma engineering expertise** — the technical standard is the product; **innovate and create efficient solutions** — standardise what repeats, so engineers spend their hours on what is actually new; **team up and leverage our global knowledge** — Bangalore is not a cost centre, it is half the department; and **exceed customer expectations** — Novo Nordisk is the customer, and the patient is the reason the cable is pulled correctly. I also value what you say about people: a people business, flat hierarchy, and a start that is taken seriously. I lead the same way — visible, on site, and with the door open.

Practically: I live in Måløv, about an hour from Kalundborg, and I will be on site five days a week — that is where an engineering department is led. I can start by agreement, and I can be reached on +45 93 99 95 14. I would welcome a conversation about how the E&I department is organised today, where the capacity pressure is greatest, and what the next two years of Kalundborg projects will demand of the discipline.

Kind regards

Shahram Ajloo

PROFILE

Department manager and E&I project engineer with 20+ years from electrical and instrumentation work, regulated pharma production and technical operations — authorised marine engineer with Danish electrical authorisation (LV/MV/HV) and a B.Tech in Technology Management & Mechanical Engineering. Twenty years of people leadership: 37 capital projects with 25 specialists and zero critical findings at Novo Nordisk, 14 employees at Ventek-Air, five electricians and three apprentices with full P&L at ELOHVAC. Runs departments on capacity, competence and documentation — and delivers projects while doing it.

LEADERSHIP, E&I DELIVERY AND RESULTS

- **Department and resource management:** Capacity and competence ownership: resource allocation across 37 parallel projects, 14 employees in a project organisation, five electricians with full P&L; recruitment, 1:1s and succession planned before the gap appears.
- **E&I project execution:** Senior commissioning engineer and project manager for electrical systems at Novo Nordisk: instrument and IO documentation, panel and cable schedules, loop checks, FAT/SAT, IQ/OQ/PQ and audited handover — DKK 2–10m per project, zero critical findings, GMP/FDA/EMA.
- **Technical standards and quality:** Discipline standards and design reviews at fixed milestones; documented acceptance criteria, deviation handling and traceability from requirement to test — written so a colleague who was not in the room can approve it.
- **GMP, GEP and audit readiness:** Two years inside a GMP/FDA/EMA organisation with change control, CAPA and inspections as daily conditions; good engineering practice applied so the documentation is produced with the work, not after it.
- **Digital tools that free up hours:** Python, Claude API, SAP and Excel in daily use: traceability matrices, IO and deviation logs, alarm and capacity statistics, dashboards and investment cases with NPV and IRR — over 40 % of the administrative work removed from quoting and follow-up.

TOOLS AND METHODS

Task	Tool and documented use
Electrical and instrumentation	Single-line diagrams, panel and cable design, instrument index and loop documentation, IO lists, ATEX considerations and electrical authorisation LV/MV/HV.
Control and automation	PLC and SCADA-based systems, BMS/FMS, sensor and control loops, alarm limits and escalation; interface protocols such as Modbus and BACnet.
Qualification and validation	URS and design review, risk assessment and FMEA, FAT/SAT, IQ/OQ/PQ, traceability matrix, deviation and change control — with acceptance documented at every gate.
Project and portfolio	Stage plans, milestone plans and shutdown schedules; resource and capacity planning across a portfolio of parallel projects, with named owners and a weekly committed-versus-coming review.
People and organisation	1:1s and performance dialogues, competence matrix per engineer, onboarding and mentoring by senior specialists, recruitment and retention in a competitive engineering market.
Safety and compliance	LOTO, workplace assessment, permits and near-miss reporting; GMP/GEP and authority requirements built into plan and contract.

EXPERIENCE

Owner / Technical Director — ELOHVAC ApS · Copenhagen, Denmark · May 2023–present

Scope: 5 electricians and 3 apprentices · full P&L · commercial and industrial customers

- **People and profit:** Recruitment, 1:1s, competence matrix and apprentice training alongside budget, quoting, margin and purchasing; customers informed the same day something changes.
- **Technical delivery and digital:** Electrical panels, motor controls, variable speed drives and control systems, tested and documented; Python and Claude API for quotations, scheduling and KPI dashboards — over 40 % productivity gain.

Senior Commissioning Engineer / Project Manager, electrical systems — Novo Nordisk A/S · Kalundborg / Bagsværd, Denmark · Nov 2022–Jul 2024

Scope: 37 parallel capital projects · 25 specialists · DKK 2–10m each · GMP/FDA/EMA

- **Commissioning and qualification:** Acceptance criteria, FAT/SAT and IQ/OQ/PQ with traceable documentation and deviation handling; zero critical findings at handover.
- **Coordination and reporting:** Progress, cost, risk and resources across engineering, procurement and operations; monthly reporting to management and to the client.

Project and Workshop Manager — Ventek-Air · Copenhagen, Denmark · Jan 2022–Nov 2022

Scope: 14 employees · 11 parallel construction projects · DKK 2–10m each

- **Team and delivery:** Tenders, calculations, subcontractors and handover packages in ventilation and technical installations; daily board meetings and bottleneck analysis.

Maintenance and Operations Manager / Workshop Technician — Biofos, Lynetten · Copenhagen, Denmark · Aug 2017–Jan 2022

Scope: 24/7 plant · pumps, HVAC, high-voltage switchgear, SCADA · shift teams and technical staff

- **Operations and maintenance:** Preventive maintenance from SCADA condition data; alarm handling, fault diagnosis and corrective work prioritised by consequence in shift operations.
- **Safety and standards:** LOTO, workplace assessment, risk assessment and near-miss reporting; standard work, 5S and PDCA on the workshop floor.
- **Shift teams:** Planned shifts, training and cover for a 24/7 operation — twelve technicians across rotations, with competence and availability balanced every week.

Electromechanical Technician / Production Team Leader — ARJ Engineering · Tehran, Iran · Dec 2003–Mar 2010

Scope: 12 mechanics and technicians · machine workshop · industrial equipment

- **Team and equipment:** Shift planning, material control and target follow-up; fault diagnosis, root-cause analysis and corrective actions on production equipment.

EDUCATION AND AUTHORISATION

B.Tech, Technology Management & Mechanical Engineering · Copenhagen School of Marine Engineering & Technology Management · 2017–2022 · EQF 6 · GPA 7.6/12

Authorised marine and electrical engineer (LV/MV/HV) · Danish Safety Technology Authority · May 2023

Electrical and mechanical design, electrical engineering · Tehran Technical University · 2000–2003 · EQF 6

Refrigeration and air conditioning · STCW safety and engine-room watch · Mercantec 2021 · Danish Maritime Authority 2021–2023

LANGUAGES, PRACTICAL AND REFERENCES

Danish: native · English: professional, written and spoken · Persian: native · Driving licence B · Lives in Måløv, about an hour from Kalundborg, and on site five days a week · Available by agreement · SAP and Excel in daily use · References from Novo Nordisk and Biofos, and from customers and partners in my own company, on request.

WHAT THE ROLE ASKS FOR — MY EVIDENCE

Requirement	Evidence
At least 5 years of leadership experience	Twenty years: owner with full P&L and 5 electricians plus 3 apprentices (2023–), 14 employees at Ventek-Air (2022), 12 technicians at ARJ (2003–2010) and 37 projects with 25 specialists at Novo Nordisk (2022–2024).
BSc or MSc in Electrical Engineering, Automation or related	B.Tech in Technology Management & Mechanical Engineering (EQF 6) with electrical and mechanical design and electrical engineering studies at Tehran Technical University, plus Danish electrical authorisation at LV, MV and HV.
Leading and developing a team of around 11 employees and consultants	Led teams of 5, 12 and 14 plus consultants and subcontractors; competence matrix, 1:1s, mentoring and recruitment as standing practice — and strong professional relationships with customers and stakeholders built in every project.
Managing resource allocation across projects and portfolios	Allocated 25 specialists across 37 parallel capital projects at Novo Nordisk, and staffed 11 parallel construction projects from a 14-person organisation at Ventek-Air.
Project contribution with technical and managerial leadership	Hands-on in the discipline while leading: design reviews, FAT/SAT, loop checks, testing and commissioning, IQ/OQ/PQ and audited handover — zero critical findings.
Driving competency development with senior specialists	Built competency matrices and apprentice programmes, and worked alongside senior specialists in pharma projects and technical operations.
Fluency in written and spoken Danish and English	Danish native, English professional written and spoken, Persian native; years in English-speaking, international project organisations, including teams in Bangalore, India.
Knowledge of GMP and GEP requirements	Two years in a GMP/FDA/EMA organisation: change control, deviations, CAPA, audit readiness and documentation produced as part of the delivery — good engineering practice in daily use.

FIRST 90 DAYS — CAPACITY, COMPETENCE AND DELIVERY

Period	What happens, and how it is measured
Week 1–2	Meet every engineer and consultant in the department: what they own, what they are good at, and where the work hurts. Read the live project list, the capacity picture and the last two handovers. One day on site in Kalundborg with the E&I team, boots on.
Day 30	One page: who is allocated where, what is committed for the next quarter, which competencies are thin, and the three biggest risks in the discipline. Weekly capacity review running with named owners, and a standing slot with the Bangalore counterpart.
Day 60	Discipline standards agreed for instrument index, loop documentation and panel design, with two design review gates that projects actually use. Competence matrix complete, one recruitment decided and one senior specialist paired as mentor.
Day 90	A resourcing plan for the next two quarters that the portfolio manager can plan against, at least one reusable package (review checklist or test template) in use across two projects, and a written way of working between Denmark and Bangalore that does not depend on me being in the room.

THE DISCIPLINE IS THE PRODUCT

In E&I the deliverable is not a drawing; it is certainty. Certainty that the instrument is specified for the medium and the hazardous area, that the loop will control what the process needs, that the panel is buildable and maintainable, that the cable is sized and labelled, and that it can all be traced from the requirement to a signed test. When that certainty is present, commissioning is short and qualification is quiet. When it is missing, every hour saved in design is paid back three times on site.

RESOURCE ALLOCATION: ONE BOARD, NAMED OWNERS

Capacity is the scarcest resource in pharma engineering, and it is invisible until someone makes it visible. One board, updated weekly, showing every person against every project, the committed hours and the incoming demand for the next two quarters — with a named owner per discipline scope and a rule for who decides when two projects want the same specialist. That is how 25 specialists were shared across 37 parallel projects without anyone working two full-time jobs.

TECHNICAL EXCELLENCE YOU CAN AUDIT

Excellence in this discipline is repeatable: standard templates for the instrument index, loop and cable documentation, panel and ATEX design, and qualification; design reviews at three gates — concept, detailed design and pre-FAT — with someone from another discipline in the room; and checklists that make FAT/SAT and IQ/OQ/PQ a confirmation rather than a discovery. Every standard we write once is an hour returned to every future project, and it is how a department grows without diluting its quality.

GROWING ENGINEERS, NOT JUST FILLING ROLES

A department of eleven people is a department of eleven careers. I want a competence matrix that shows each engineer's depth across instrument types, control systems, electrical design and qualification work, and a plan for the next step — whether that is specialist depth or project leadership. Senior specialists should be mentoring by default, and the difficult projects should be where someone grows, not where someone drowns. I have trained apprentices, technicians and engineers, and I have hired for attitude as often as for experience.

DENMARK AND BANGALORE, ONE TEAM

Distributed engineering only works when the interfaces are designed as carefully as the panels. That means overlapping hours for the handover, one source of truth for documents and status, written scope before work travels, and the same standards in both places — plus the discipline to say what is decided and what is still open. I have run projects where engineering, procurement and operations sat in different countries, and the ones that went well were the ones where the interface was owned by a person with a name, not by a process diagram.

GMP, GEP AND THE AUDIT TRAIL

In an API plant, GMP and good engineering practice are the same thing done honestly: requirements before design, design before purchase, tests before release, and a record of every deviation with a root cause and a verified corrective action. I have worked where a missing signature stops a batch release, and I have handed over systems that were inspected without a critical finding. A department that produces its documentation while it works never needs a rescue operation before an audit.

DIGITAL WORK THAT GIVES HOURS BACK

I build my own tools in Python and Claude: traceability matrices that stay in step with the test list, IO and deviation logs filtered by area and owner, capacity and alarm statistics pulled into one page, and investment cases with NPV, IRR and scenarios. It does not replace the validated systems or the engineering judgement, and it stays inside the procedures — but it makes follow-up fast enough that engineers actually do it.
