4 November 2026

2Refurb · CTO · Silkeborg, Denmark (and Council Bluffs, Iowa)

Application: CTO — the technical foundation behind the engineering judgement

To 2Refurb and Martin Frølich Olesen

You write that 2Refurb does not sell parts off a shelf, but the engineering judgement behind them. That sentence is the job: judgement only becomes a product when it is written down, testable, and repeatable by the technician who opens the next unit in Silkeborg or Council Bluffs. Below is how I would build that foundation — following one component through your own process.

Intake — the condition of the unit sets the scope. Everything promised later is decided when the part is opened: what it is, what it failed from, and whether it is worth the hours. I have spent twenty years on that decision in electrical and electro-mechanical plant — pumps, motors, switchgear, control panels, SCADA — inspecting, fault-finding and writing down why a part was kept, repaired or replaced.

Failure modes — a library, not a memory. Component types, failure modes, refurbishment methods and acceptance criteria belong in something a new technician can use on day one. I have worked to **A3, 5-why and Ishikawa** in a validated production environment where an undocumented deviation is a finding, and built the standard work that kept **24/7 plant** running at Lynetten.

Test and inspection — the protocol is the product. A refurbished part is only as good as the test that releases it: what is measured, with which instrument, at which load, against which limit, recorded where. I have witnessed and signed **FAT/SAT** and **IQ/OQ/PQ** under GMP/FDA/EMA — protocols that do not accept "it works" as evidence — and I have been the one who refuses acceptance when the evidence is not there.

Quality in production — caught at the station, not at the end. Built-in quality means the measurement happens while the unit is still open: first-off checks, hold points, and a technician who is allowed to stop a job. Across **37 concurrent capital projects** the deviations we discussed were the ones caught early — **zero critical findings at handover** is a habit, not a final inspection.

Warranty and complaints — the failure is data. A claim is an engineering question with a date on it: what failed, how it failed, whether it is the component, the method or the application — and whether the standard has to change. Root cause with 5-why and Ishikawa, the corrective action written into the method, and an answer the customer's engineers can check themselves.

Sales, operations and procurement — feasibility before the quote leaves the building. The engineering input behind a commercial decision is a yes, a no or a yes-if: can this unit be brought back to specification, what does the test require, what must the customer documentation say. I have quoted, costed and delivered from my own P&L since 2023, so the judgement arrives with the number attached.

R&D, improvement and digital — good engineering has to scale. Which component types fail, at what hours, from what cause, at what cost: that only becomes knowledge when it sits in one place. I have built the reporting layer myself — **SAP ERP** for orders and cost, **Power BI** and **Python** for dashboards and quote calculation — and measured **above 40 % productivity gain** from letting the routine work flow through the system instead of through me.

Certification and documentation — the licence to keep selling. A certificate is what allows the part to go back into a turbine and the company to keep quoting. Danish **HV/LV** authorisation, **DS/HD 60364** and the SB guidance are my working frame; the documentation discipline comes from pharma, where the file itself is inspected.

The electric area — where I strengthen you. Electrical engineering at EQF 6, twenty years of electrical and electro-mechanical work, and a Danish HV/LV authorisation: **switchgear, motors, control systems, panels, SCADA**, and instruments in hand. Wind turbine components — **converters, motors, switchgear, sensors, control electronics** — are electro-mechanical assemblies, and testing, judging and documenting them is the discipline I have practised at component and at plant level.

The management team — and two sites. A CTO in a company this size sits in the management team with a sales team relying on his judgement, and works between Silkeborg and Council Bluffs. I have run a business with full P&L, been part of the management team of a 24/7-plant operation, and worked in English, Danish and Persian across countries. I live in Måløv and travel where the role requires it.

I would like to hear which component families cause you the most warranty work today, where the test protocols are thinnest, and how far the digital systems reach into the workshop — and I would be glad to bring the first standard with me.

Yours sincerely

Shahram Ajloo

Technical leadership · Electrical and electro-mechanical engineering, testing and standards

+45 93 99 95 14 · ajlooshahram@gmail.com · linkedin.com/in/shahramajloo · Måløv, Denmark

PROFILE

Technical leader in electrical and electro-mechanical engineering with 20+ years at the plant and the test bench — **Danish HV/LV authorised engineer (elautoriseret maskinmester, LV/MV/HV)**, electrical engineering at EQF 6 plus a B.Tech, and full P&L responsibility since 2023. Has written standards, test and acceptance criteria into daily work across **37 capital projects** with **25 specialists**, closed them with **zero critical findings**, driven root cause with **A3, 5-why and Ishikawa**, and built the digital layer in **SAP ERP, Power BI and Python** on **above 40 % productivity gain**. English professional, Danish native.

TECHNICAL STANDARDS, TEST AND QUALITY

- **Standards and acceptance criteria:** Methods, work instructions and acceptance tests written down: what passes, what is rejected, who signs — applied to service agreements and to 37 capital projects.
- **Testing and inspection:** FAT/SAT witnessed at works and on site, IQ/OQ/PQ with witness points under GMP/FDA/EMA, protection proven before load, acceptance refused without evidence.
- **Root cause and improvement:** Fault diagnosis of pumps, motors, switchgear, panels and SCADA with 5-why, Ishikawa and A3; corrective action written into the method; 5S, standard work and PDCA in 24/7 operation.

ELECTRICAL, ELECTRO-MECHANICAL AND DIGITAL

- **HV, MV and LV:** HV/LV authorisation (LV/MV/HV) and DS/HD 60364/SB: switchgear, transformers, boards, cable systems, earthing, selectivity.
- **Control, instrumentation and rotating equipment:** Control panels, interlocks, sensors and SCADA/SRO operated, tested and fault-found; pumps, motors, fans and HVAC diagnosed, repaired or replaced.
- **Data, digital and commercial:** SAP ERP for orders, assets and cost; Power BI and Python (incl. AI tooling) for quoting, KPIs and checklists — above 40 % productivity gain; feasibility and specification before the price.

EXPERIENCE

Owner / Technical Director — ELOHVAC ApS · Copenhagen · May 2023–present

Scope: 5 electricians + 3 apprentices · full P&L · LV/MV/HV installations, panels and service

- **Technical standards and delivery:** Every job specified, quoted and handed over under own P&L; methods and acceptance criteria written down, after-calculation per job, zero critical deviations in service agreements.
- **Team and safety:** Five electricians and three apprentices led daily; competence matrix, LOTO, risk assessment and health and safety at every site start-up.

Senior Commissioning Engineer / Project Manager, Electrical Systems — Novo Nordisk A/S · Kalundborg/Bagsværd, Denmark · Nov 2022–Jul 2024

Scope: 37 capital projects · 25 specialists · GMP/FDA/EMA validated environment

- **Testing, acceptance and root cause:** FAT/SAT and IQ/OQ/PQ with witness points across 37 concurrent electrical capital projects; A3 and Ishikawa on deviations; zero critical findings at handover.
- **Technical input and improvement:** Specification, purchasing, engineering and site aligned; 40 % energy-cost reduction through a PDCA programme; monthly reporting in SAP ERP.

Project and Workshop Manager — Ventek-Air · Copenhagen · Jan 2022–Nov 2022

Scope: 14 employees · 11 concurrent contracts · DKK 2–10m per contract

- **Workshop and handover:** 14-person workshop and 11 concurrent contracts from specification to formal handover; subcontractor scope and acceptance documentation at daily board meetings.

Operations and Maintenance Manager — Lynetten under Biofos · Copenhagen · Aug 2017–Jan 2022

Scope: Critical plant in 24/7 operation · pumps, motors, HV switchgear, SCADA

- **Plant and failure modes:** Pumps, motors, HVAC, HV switchgear and SCADA kept running; failure modes recorded and preventive work planned from them, with 5S on workshop and store.

Electromechanical Technician / Production Team Leader — ARJ Engineering · Tehran · Dec 2003–Mar 2010

Scope: 12 mechanics and technicians · machine workshop · industrial plant

- **Diagnosis and repair:** Fault diagnosis and repair of industrial electrical and mechanical plant with root cause analysis and corrective action; 12 technicians planned and measured daily.

EDUCATION AND AUTHORISATION

Electrical and Mechanical Engineering Design, Electrical Engineering (EQF 6) · Tehran Technical University · 2000–2003

B.Tech, Technology Management and Mechanical Engineering · Copenhagen School of Marine Engineering & Technology Management · 2017–2022 · GPA 7.6/12

Danish HV/LV authorisation — elautoriseret maskinmester (LV/MV/HV) · Danish Safety Technology Authority · May 2023

Lean practice: 5S, PDCA, VSM, A3, Kaizen · Refrigeration and air-conditioning (AMU) · Mercantec · 2021 · applied in operations, testing and project follow-up

LANGUAGES, PRACTICALITIES AND REFERENCES

English: professional, written and spoken, for specifications, test protocols, customer documentation and management reporting · **Danish: native** · Persian: native · **Based in Måløv**, willing to travel to Silkeborg, Council Bluffs and customer sites · Full driving licence · Available at short notice · References on request.

THE FIRST 90 DAYS — STANDARDS, TEST AND DIGITAL

Period	What happens, and how it is measured
Week 1–2	Read the component portfolio, the current test and inspection protocols, the warranty log and the certification file; spend the days at the bench and in the workshop, not in the office.
Day 30	A map of component families against failure modes, refurbishment method, acceptance criteria and warranty history — with the gaps marked; the three protocols that cause most rework identified.
Day 60	Revised test and inspection protocols issued for the highest-volume families; hold points and first-off checks in production; root-cause template in use for every warranty claim.
Day 90	The knowledge base in one place, owned and versioned; warranty claims answered with an engineering report; the first dashboard live on failure modes, cost per refurbishment and claim rate.

A REFURBISHED PART IS A CLAIM YOU HAVE TO PROVE

The customer's engineers do not buy a repaired component; they buy the confidence that it will run for the hours they need it to. That confidence is built from three things and nothing else: a defined method, a test that reproduces the service load, and a record that travels with the part. When all three exist, the price discussion changes character — the argument is about hours and risk instead of about the invoice.

THE FAILURE-MODE LIBRARY IS THE COMPANY'S REAL ASSET

A refurbishment business knows something its customers do not: how a specific component family actually fails in the field, and what that failure costs. Written down per family — failure mode, hours to failure, inspection point, method, acceptance limit — that knowledge prices work, predicts warranty exposure and tells R&D where to look. Left in the heads of two experienced people, it walks out of the door with them.

TWO SITES, ONE STANDARD

A workshop in Silkeborg and a workshop in Council Bluffs only behave as one company if the standard travels: the same method, the same acceptance test, the same record, in a language both teams can use. That is a documentation problem before it is a management problem — one version of the instruction, one template for the test report, one place where the failure history is written. I have worked across countries and languages, and the rule that held was always the same: what is not written down is not shared.

WHAT A SCRAP CONTAINER ACTUALLY COSTS

The mission is to keep good components in operation instead of in the scrap container — wind turbines running, waste avoided — and that is an engineering target with a number behind it: every unit that is scrapped although it could have been refurbished is a lost margin, and every unit that is returned and fails again is a warranty claim and a customer who stops believing the judgement. Both are controlled the same way — a defined method, a test that reproduces the load, and a record. Standards are not bureaucracy in this business; they are the difference between a repair and a promise.

THE TEST BENCH AND THE CUSTOMER'S ENGINEER ARE THE SAME CONVERSATION

Selling engineering judgement means the person who sets the acceptance criterion can defend it in a meeting with a customer's technical department. I have done both sides: signed the protocol and then explained to a customer why the evidence was insufficient to accept the installation. That is the same skill in two rooms, and it is what makes a small technical organisation credible next to an OEM.

WHAT THE ROLE REQUIRES — WHAT I HAVE DELIVERED

Requirement in the posting	Evidence
Own the technical knowledge base and standards — component types, failure modes, refurbishment methods and acceptance criteria	Methods, acceptance tests and work instructions written down in own business and across 37 capital projects; failure modes recorded, not remembered.
Make sure testing and inspection protocols are fit for purpose, and build quality into production so issues are caught early	FAT/SAT and IQ/OQ/PQ protocols with witness points and hold points; first-off checks at the station; zero critical findings at handover.
Lead the technical response to complaints and warranty claims, including root cause analysis	Root cause with A3, 5-why and Ishikawa on deviations and repeat failures; corrective action written into the method and the customer answered with evidence.
Give Sales, Operations and Procurement the engineering input behind their decisions — feasibility, specifications and customer documentation	Feasibility, specification and customer documentation produced before the price; supplier and subcontractor scope negotiated under AB 18 and ABT 18.
Drive R&D, continuous improvement and the digital systems that connect people, processes and data	SAP ERP, Power BI and Python built into quoting, KPI and checklist work with above 40 % productivity gain; 5S, PDCA and standard work in 24/7 operation.
Keep certifications, compliance and technical documentation in order	Danish HV/LV authorisation, DS/HD 60364 and SB guidance as the working frame; documentation inspected under GMP/FDA/EMA with zero critical findings.
Be a major contributor to the management team	Owner and technical director with full P&L since 2023; member of the management team of a 24/7 plant operation and of cross-functional project leadership with 25 specialists.
Own the technical side of everything we deliver, in Denmark and the US	Technical ownership across sites and countries: Copenhagen, Kalundborg, Tehran and suppliers abroad; work in English, Danish and Persian, with travel built into the role.
Strengthen the competences within the electric area	Electrical engineering at EQF 6 plus Danish HV/LV authorisation: HV/MV/LV installations, switchgear, panels, control systems, SCADA, fault finding and testing.
An electrical engineer (BSc/MSc or equivalent) with hands-on experience in power electronics, converters, control systems or industrial electronics	Electrical engineering degree at EQF 6 (bachelor level) plus B.Tech; hands-on control systems, industrial electronics, panels and control equipment in operation and commissioning.
As comfortable at the test bench as in a technical discussion with a customer's engineers	Witnessed and signed FAT/SAT and IQ/OQ/PQ; fault finding with instruments at the plant; the same person who explains the evidence to the customer's technical department.
Structured: you document, standardise and share knowledge rather than keep it in your head	Work instructions, competence matrices and checklists in own business; documentation produced with the work in a validated production environment, where the file is the proof.
Experienced with testing, quality and root cause analysis	Testing and acceptance across 37 capital projects and 11 contracts; quality systems, deviation handling, 5-why, Ishikawa and A3 in daily use.
Curious about how automation and data can make good engineering scale	Built AI-assisted quoting, dashboards and checklists in Python and Power BI with measurable productivity gain; reporting automated on SAP ERP data.
Fluent in English; Danish is an advantage	English professional, written and spoken, for specifications, protocols and management reporting; Danish native.
Experience from the wind industry is a strong plus	Component-level electro-mechanical work — motors, pumps, switchgear, panels, control electronics — with the testing, acceptance and root-cause discipline a refurbishment operation lives from.
